

01 Scenario, description and occurrence

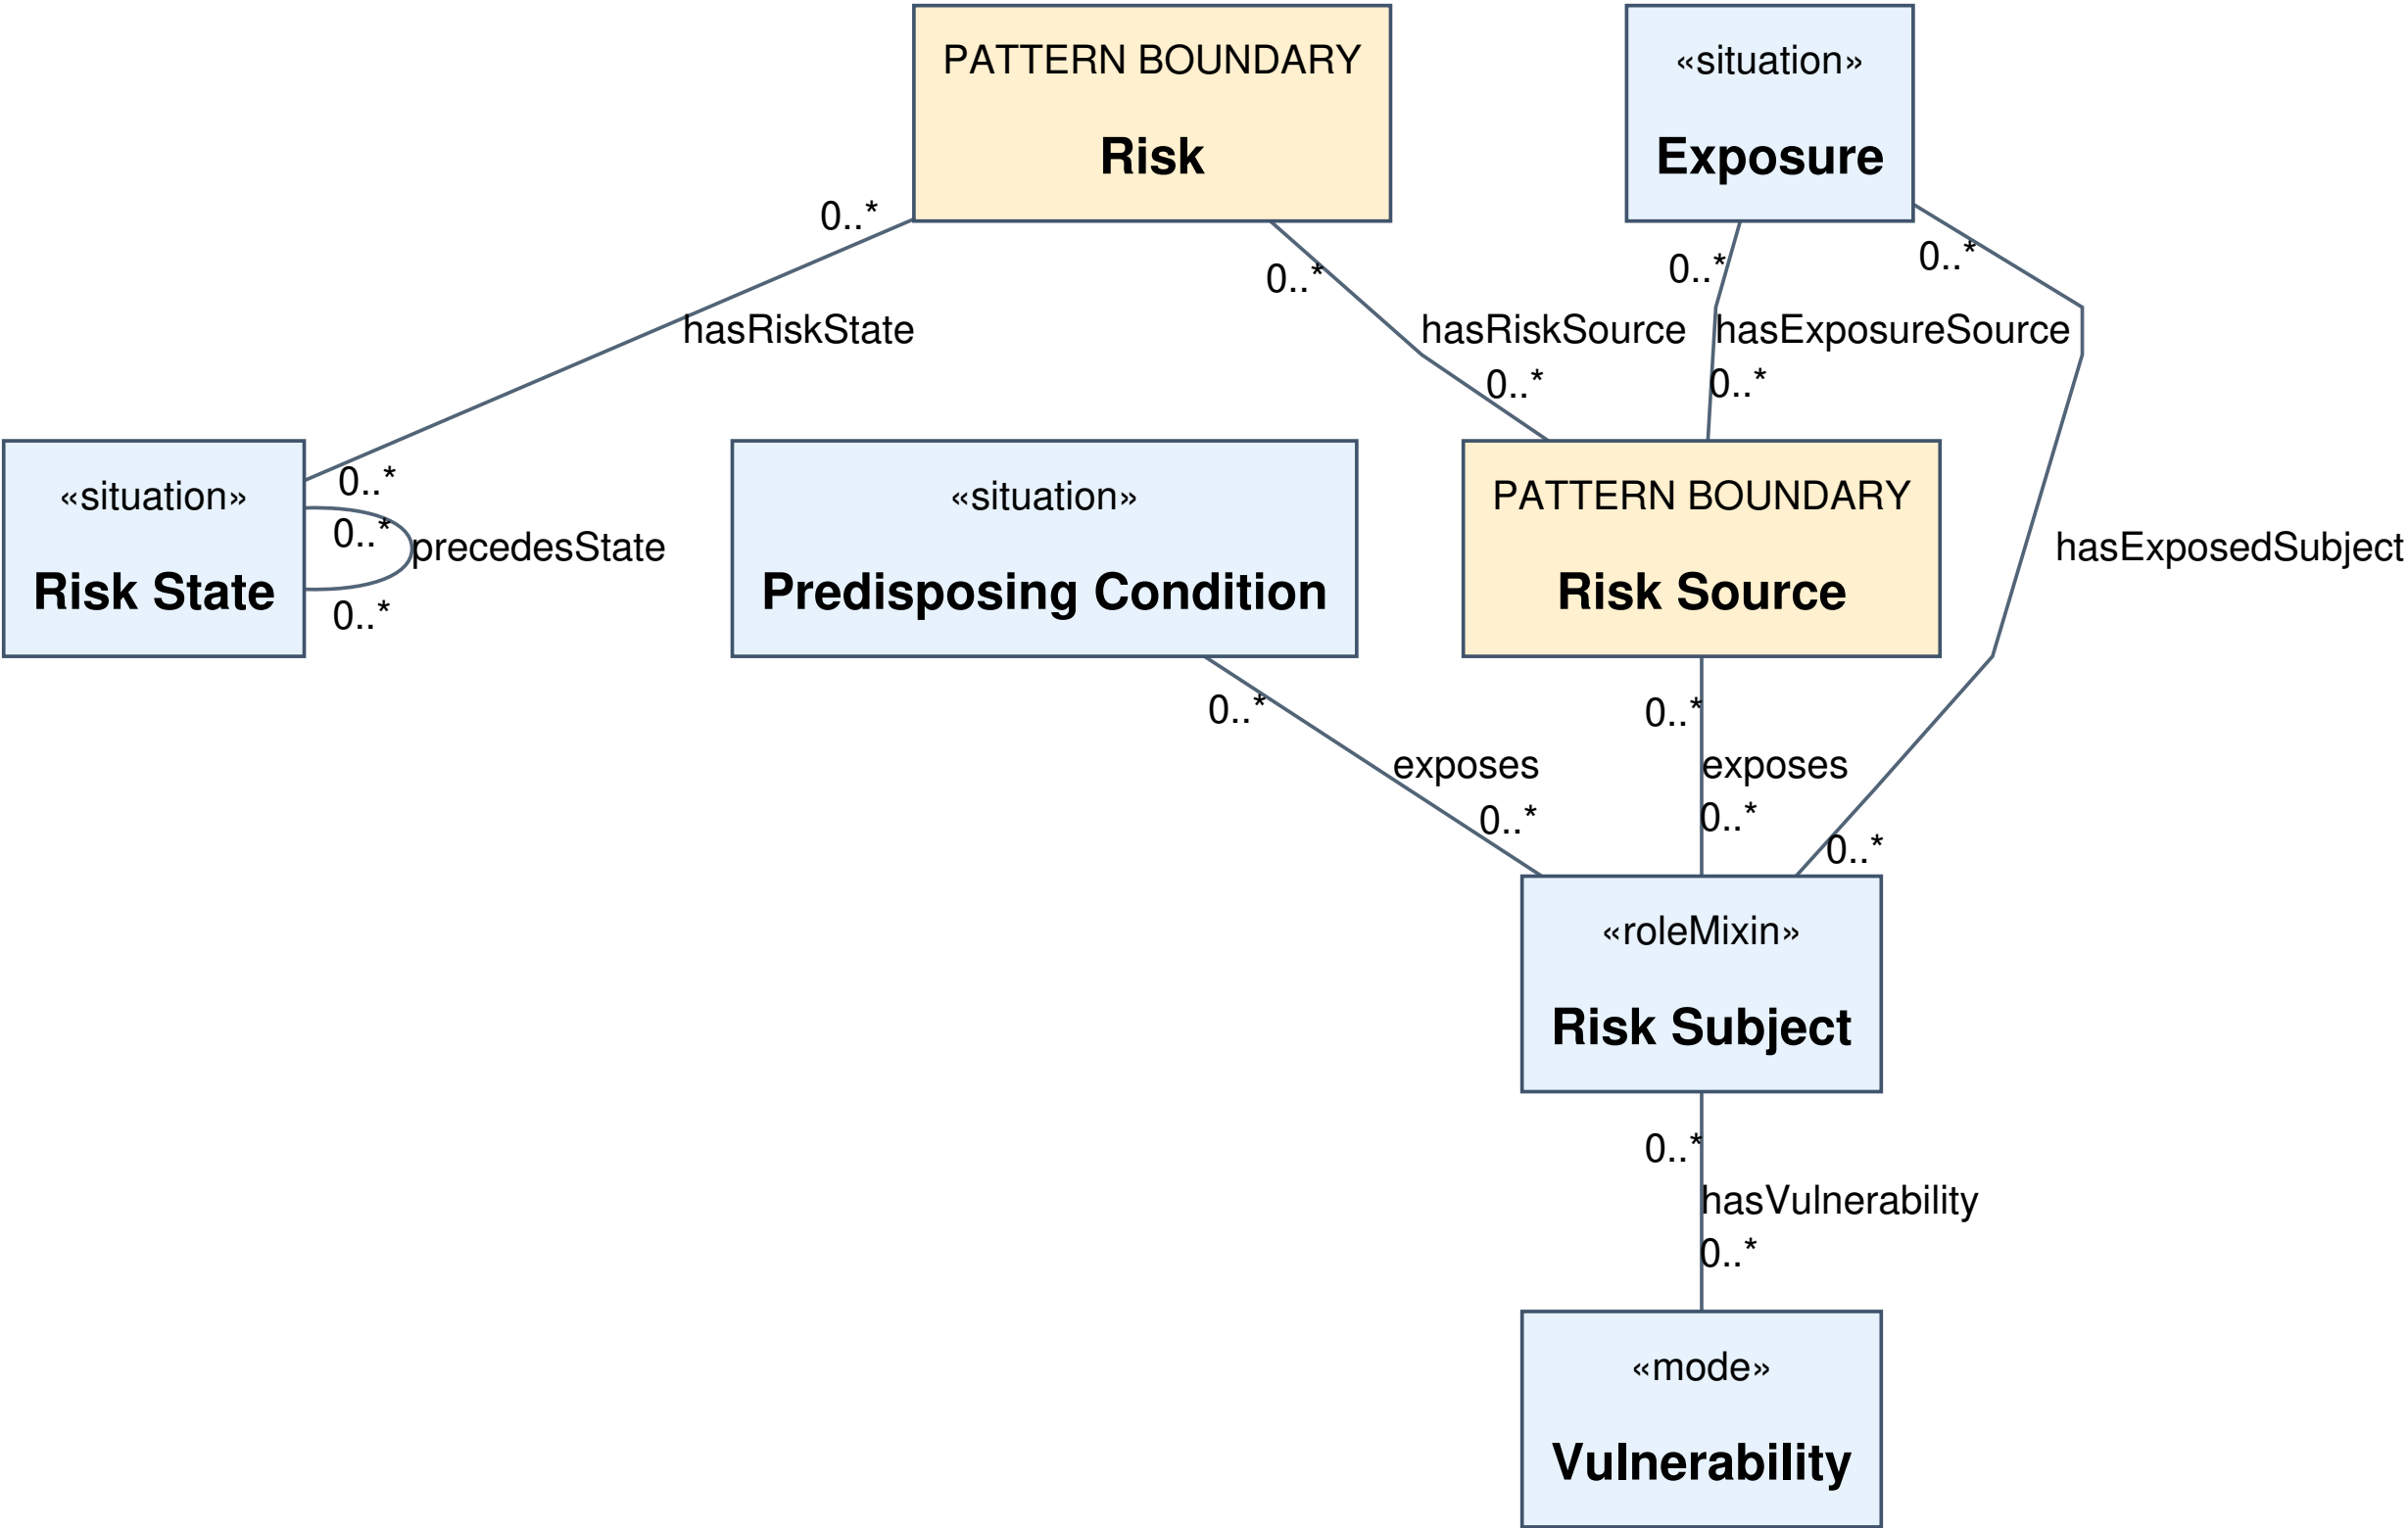

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Scenario is a second-order type; realization does not follow merely from its existence.

02 Risk patterns and situational context

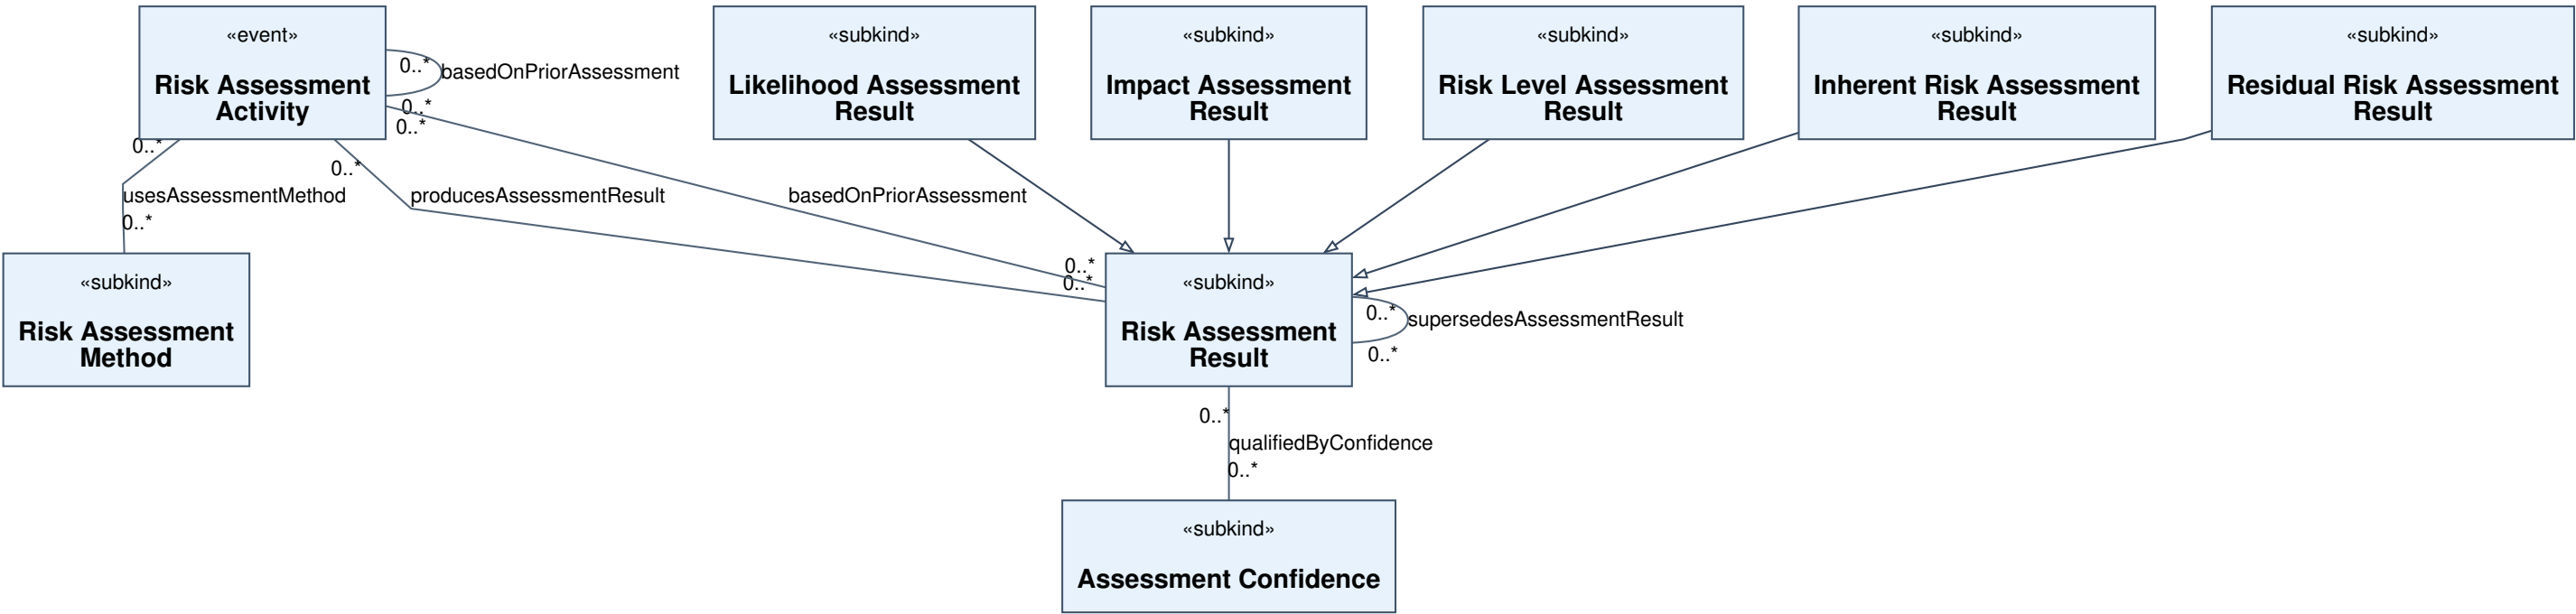

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Orange nodes are broad patterns. Exposure now has registered subject/source links; endpoint existence does not entail a risk score or outcome.

03 Assessment activity and result distinctions

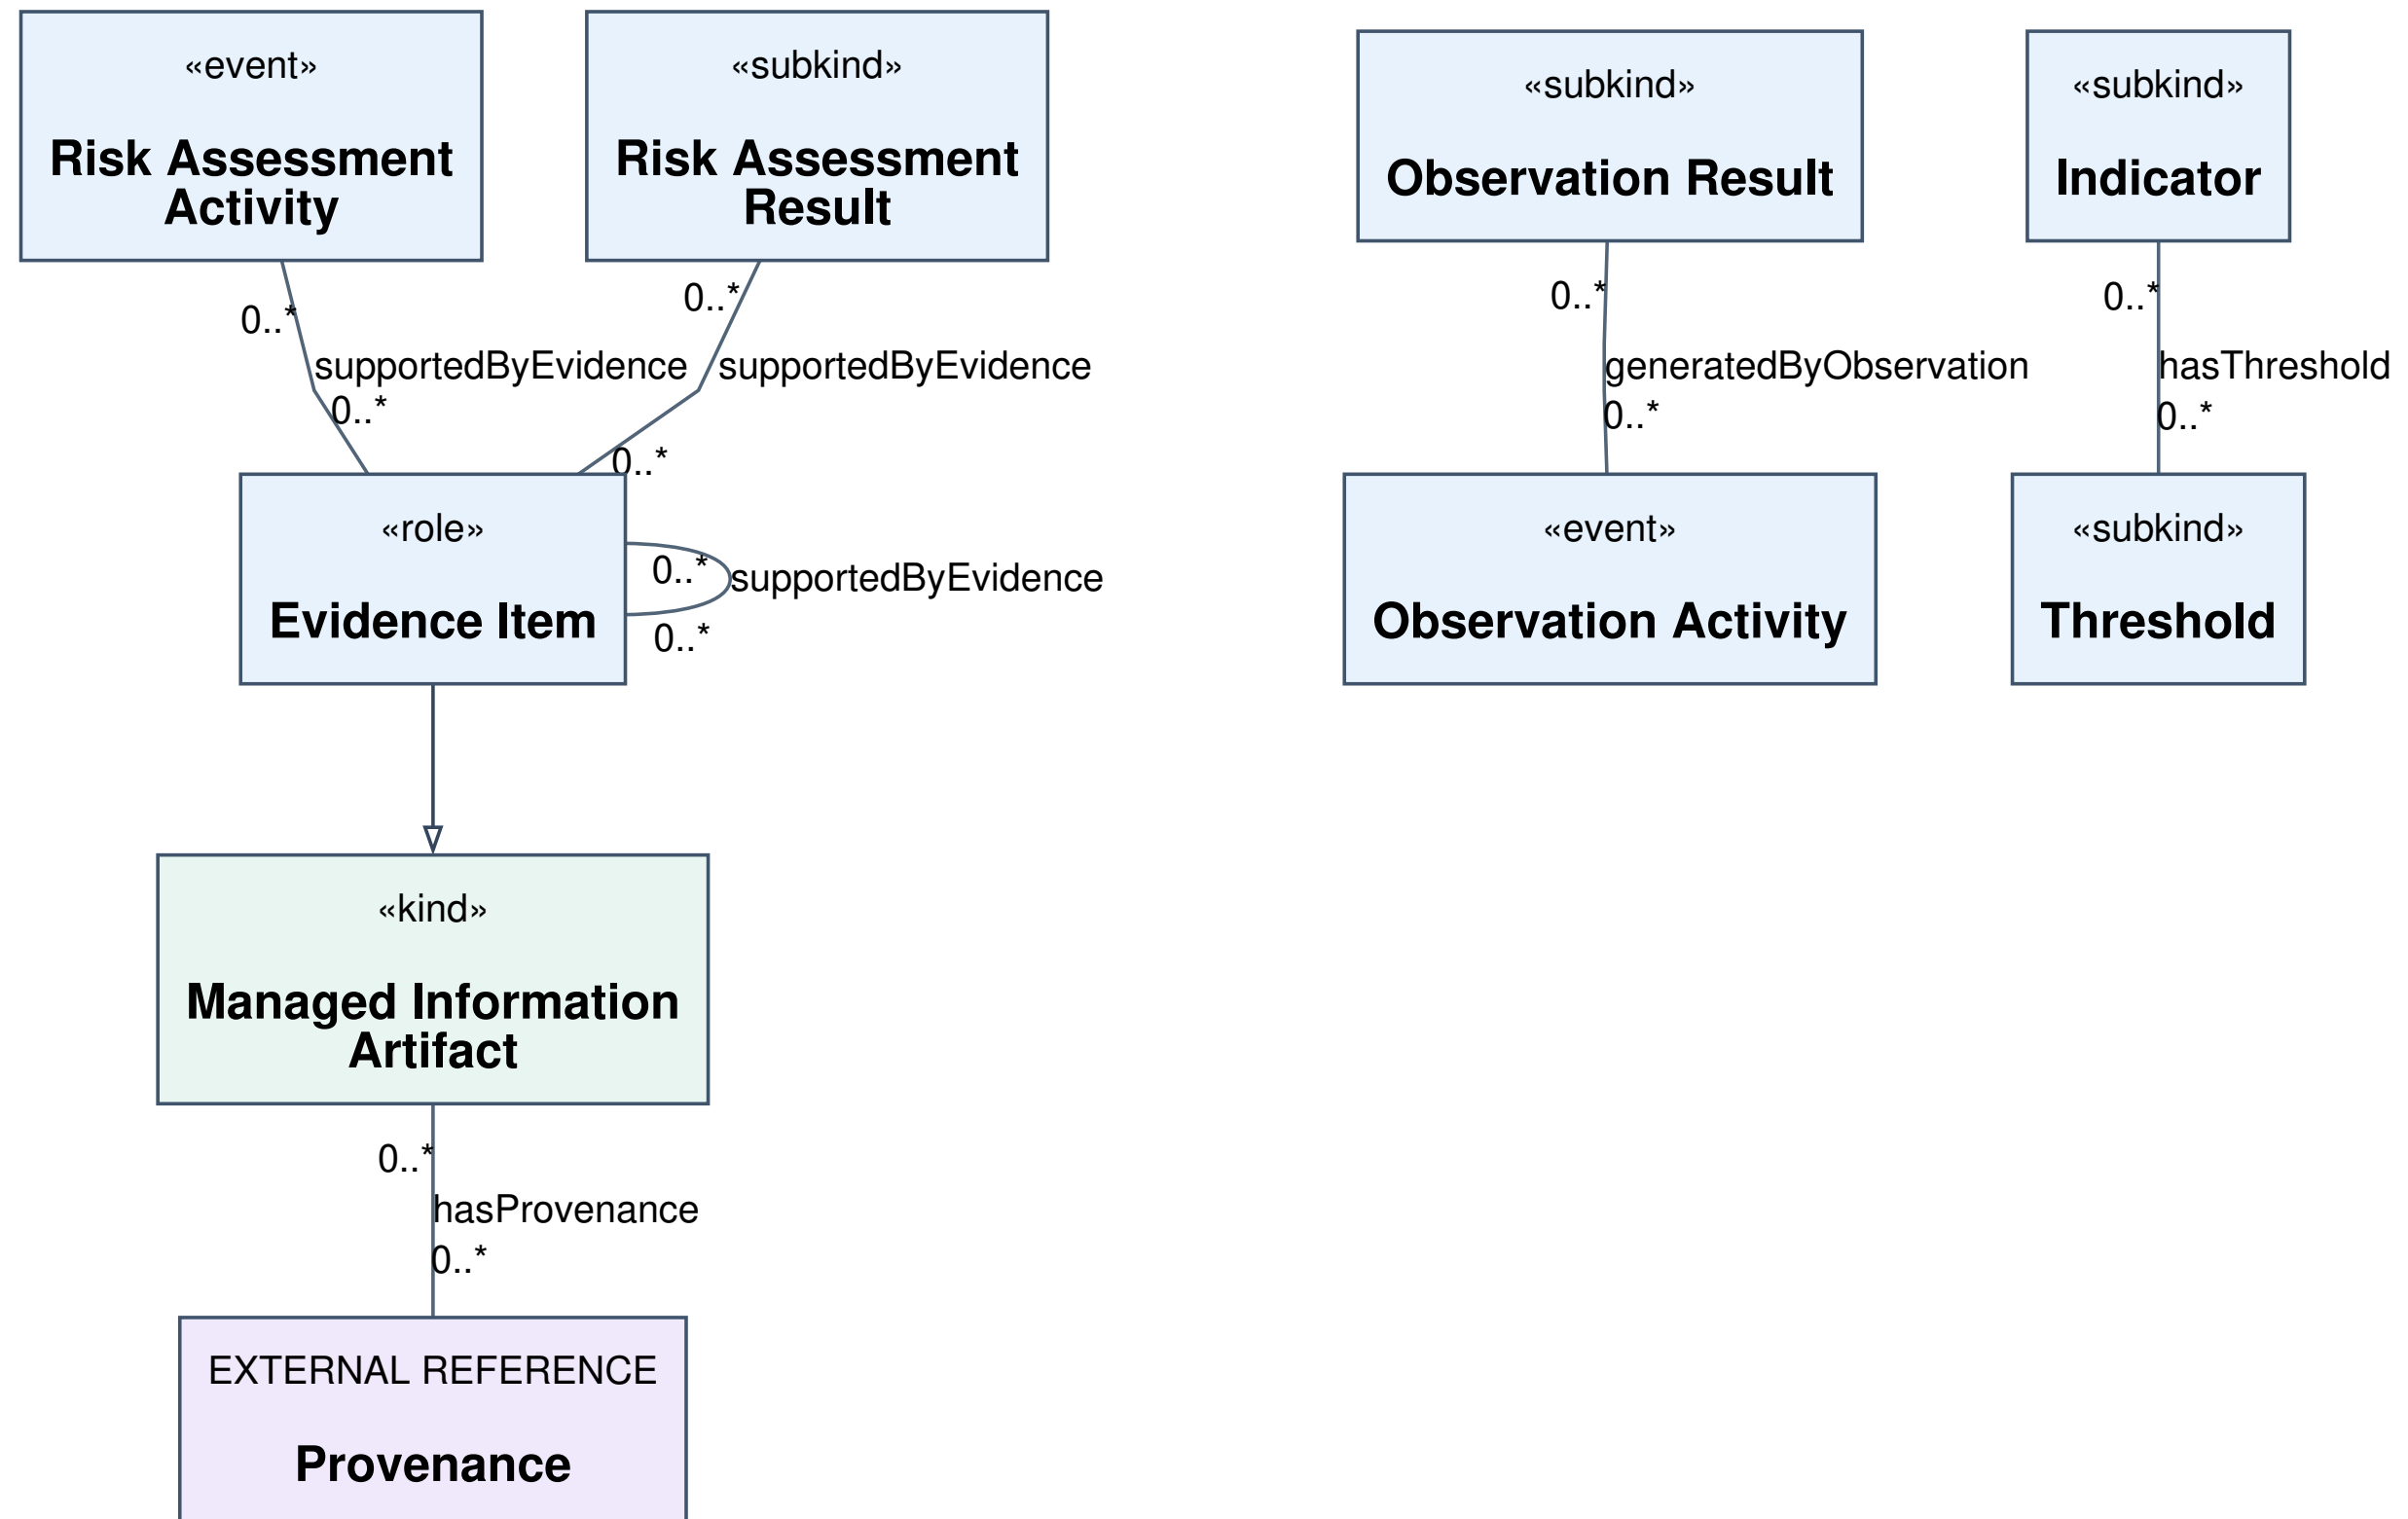

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Dimension and control-baseline subkinds may overlap. The ontology does not impose a universal score formula.

04 Observation, evidence and monitoring

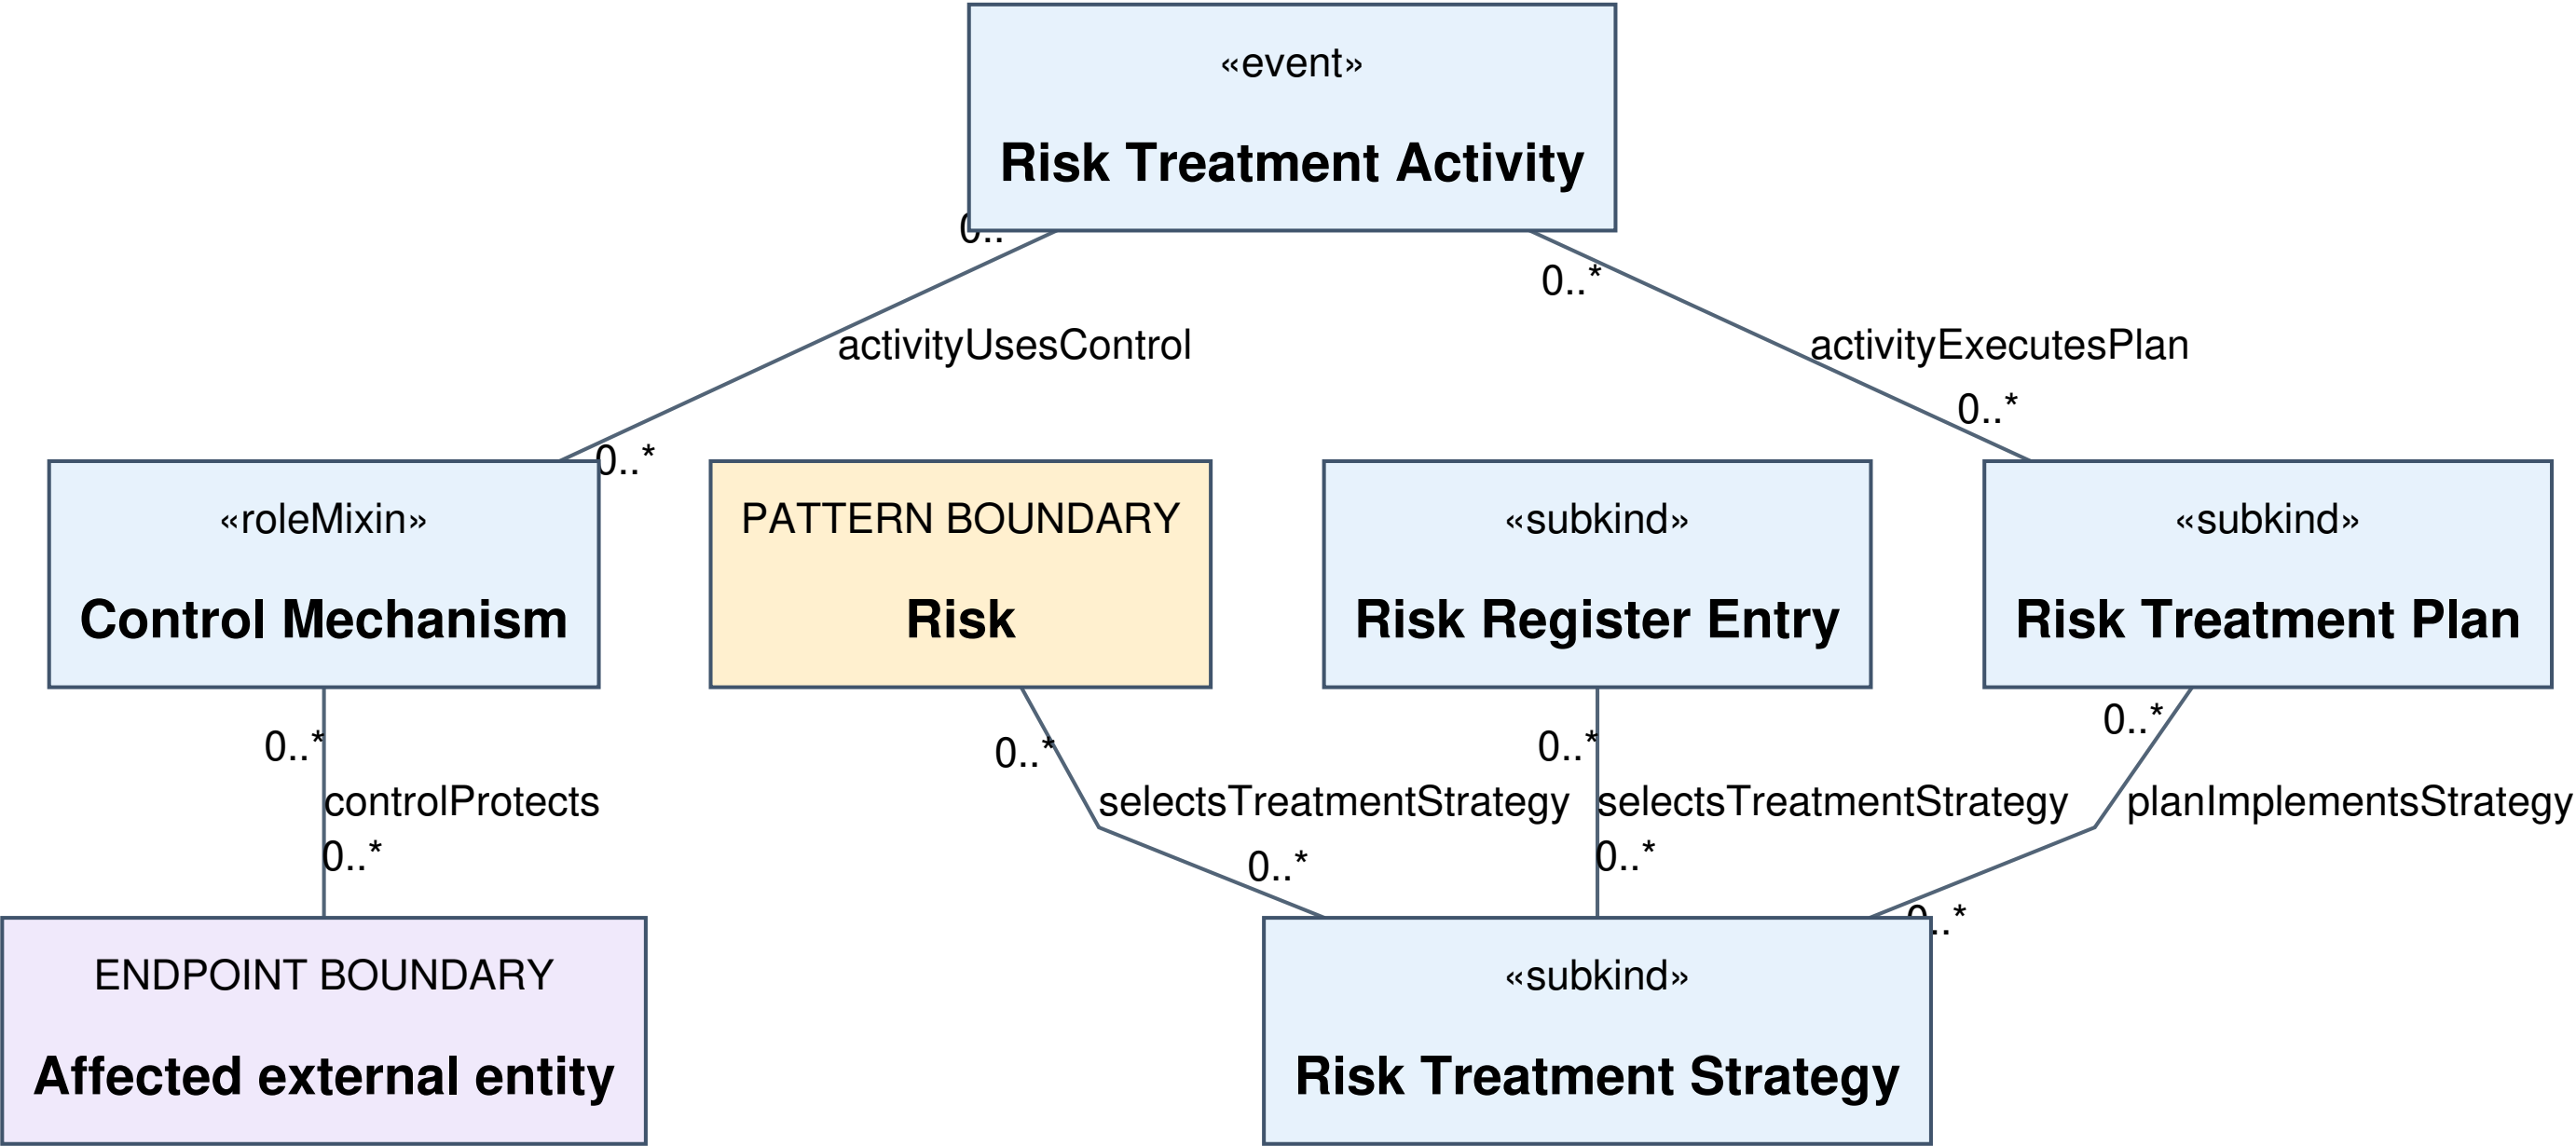

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Evidence is a contextual role. Provenance is an external pattern reference; supporting evidence does not establish truth.

05 Treatment specification and execution

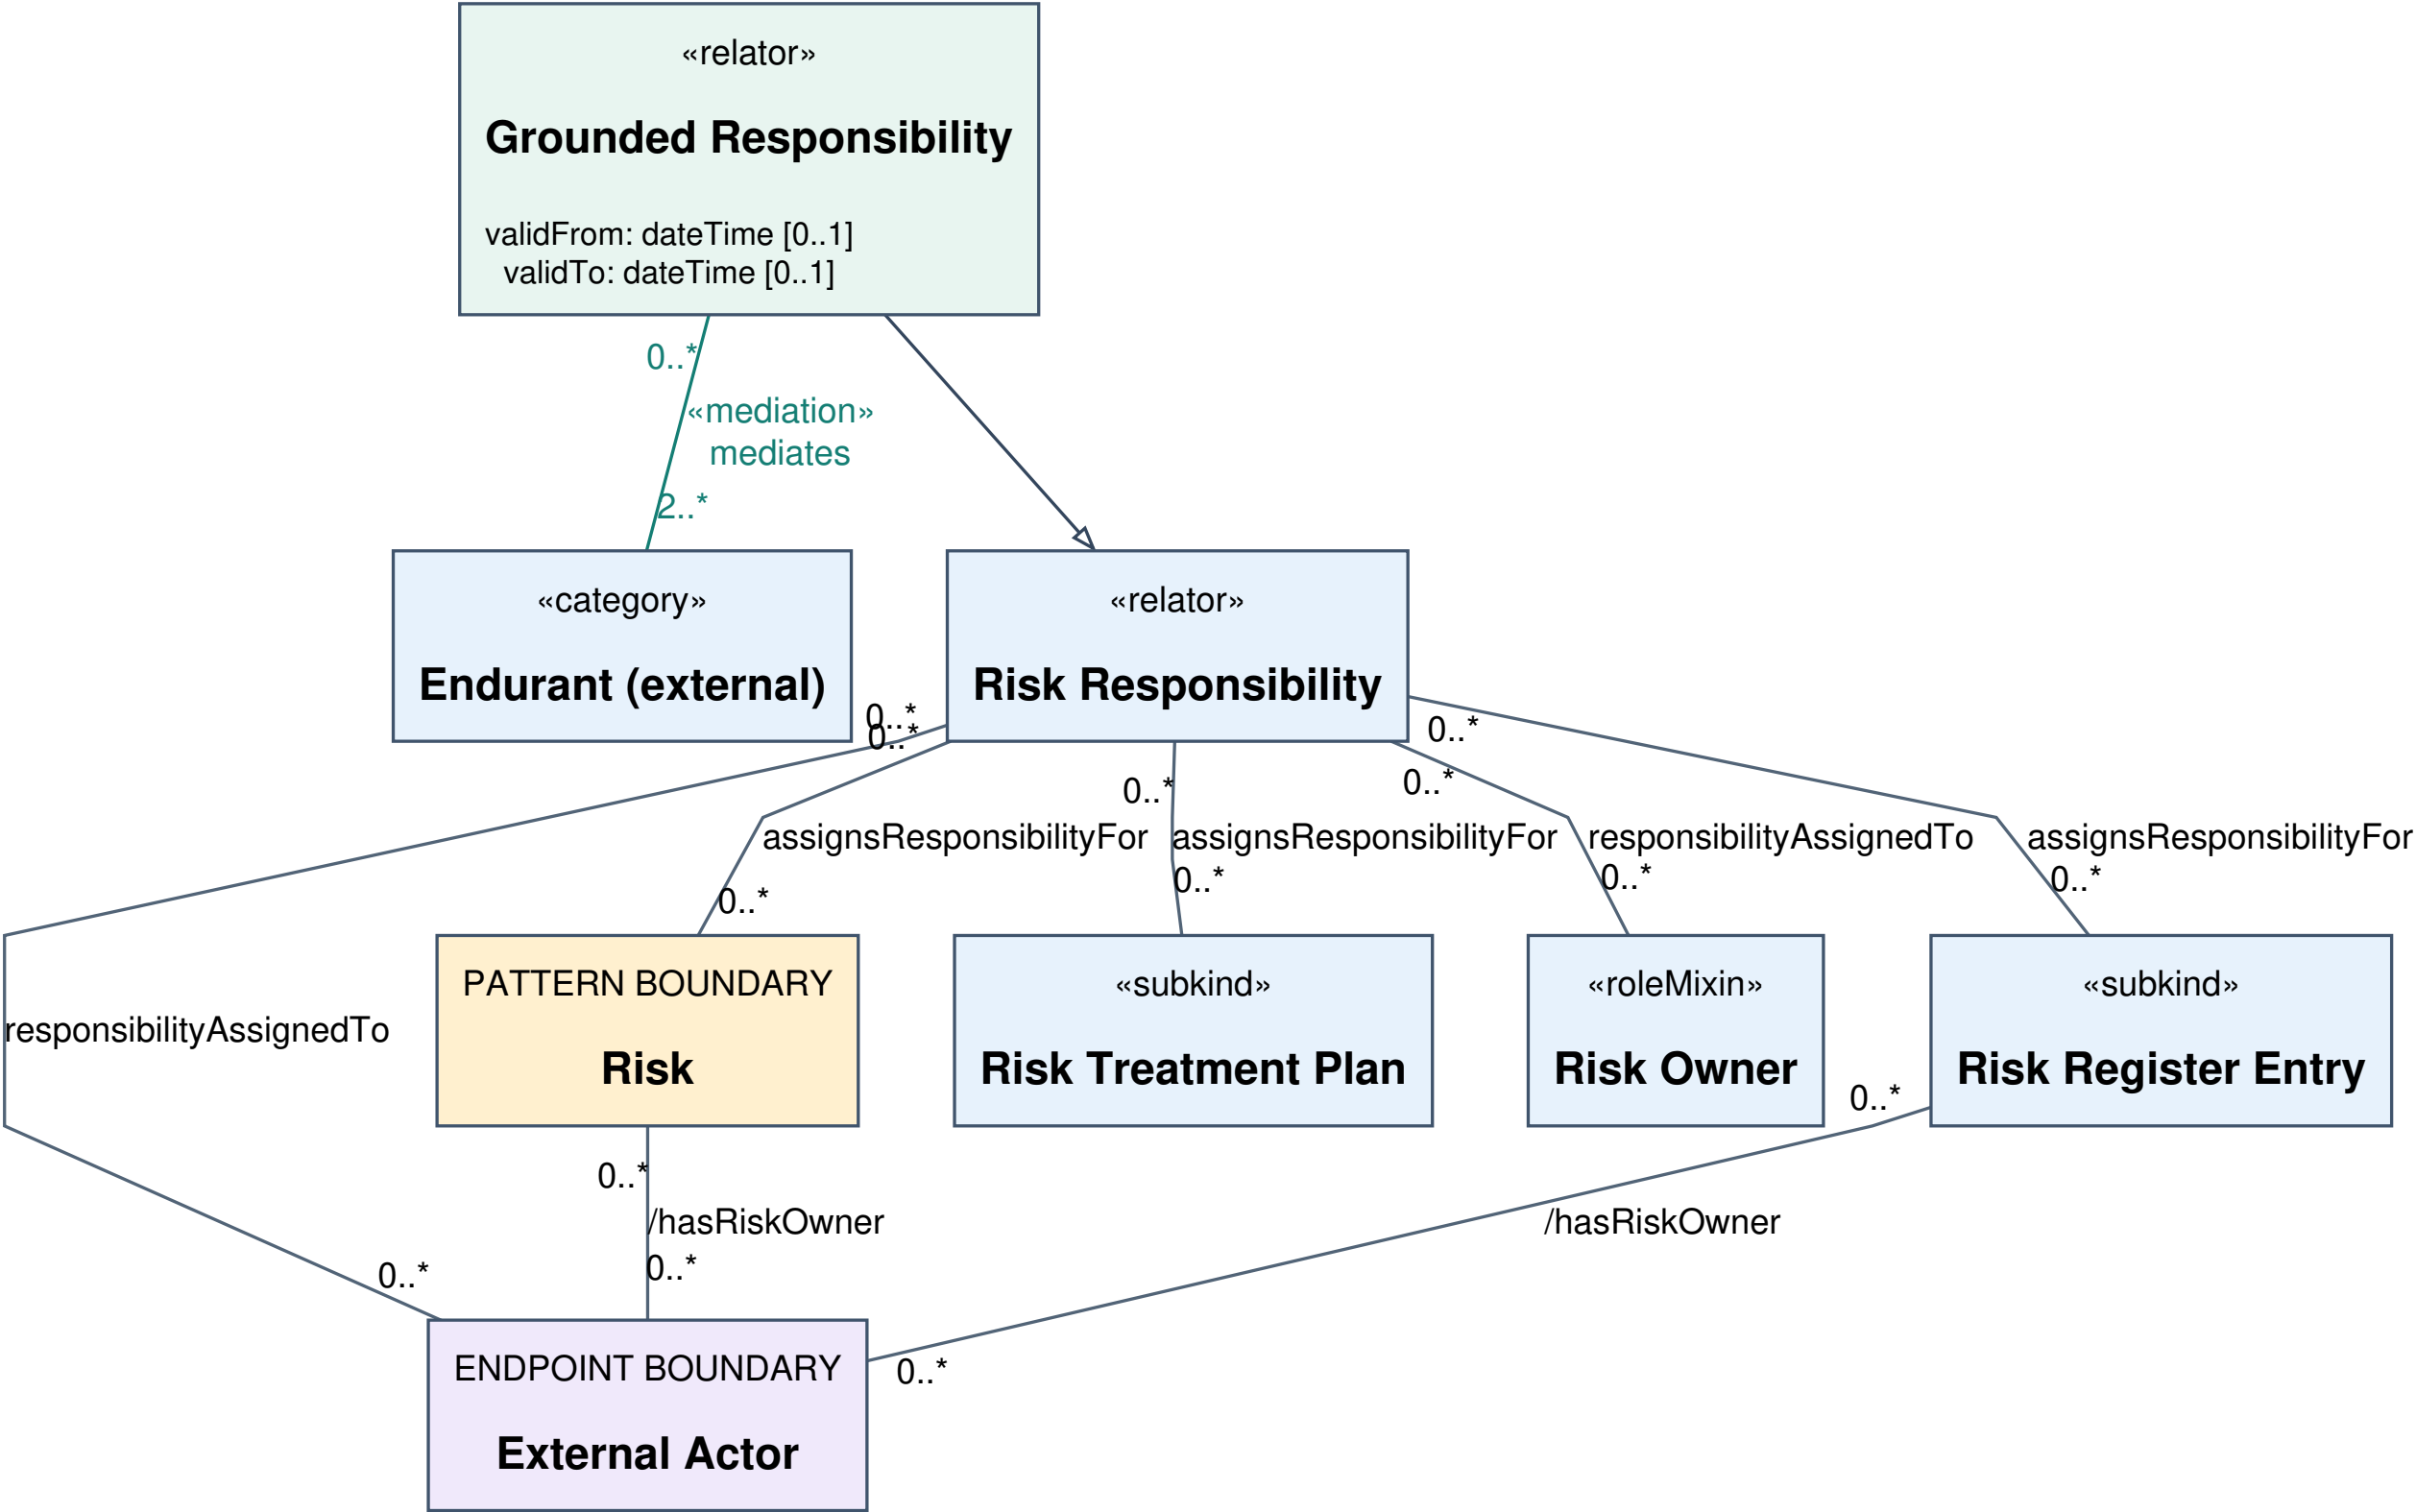

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Plan, strategy, activity and control remain distinct. A control association does not prove effectiveness.

06 Responsibility and explicit grounding

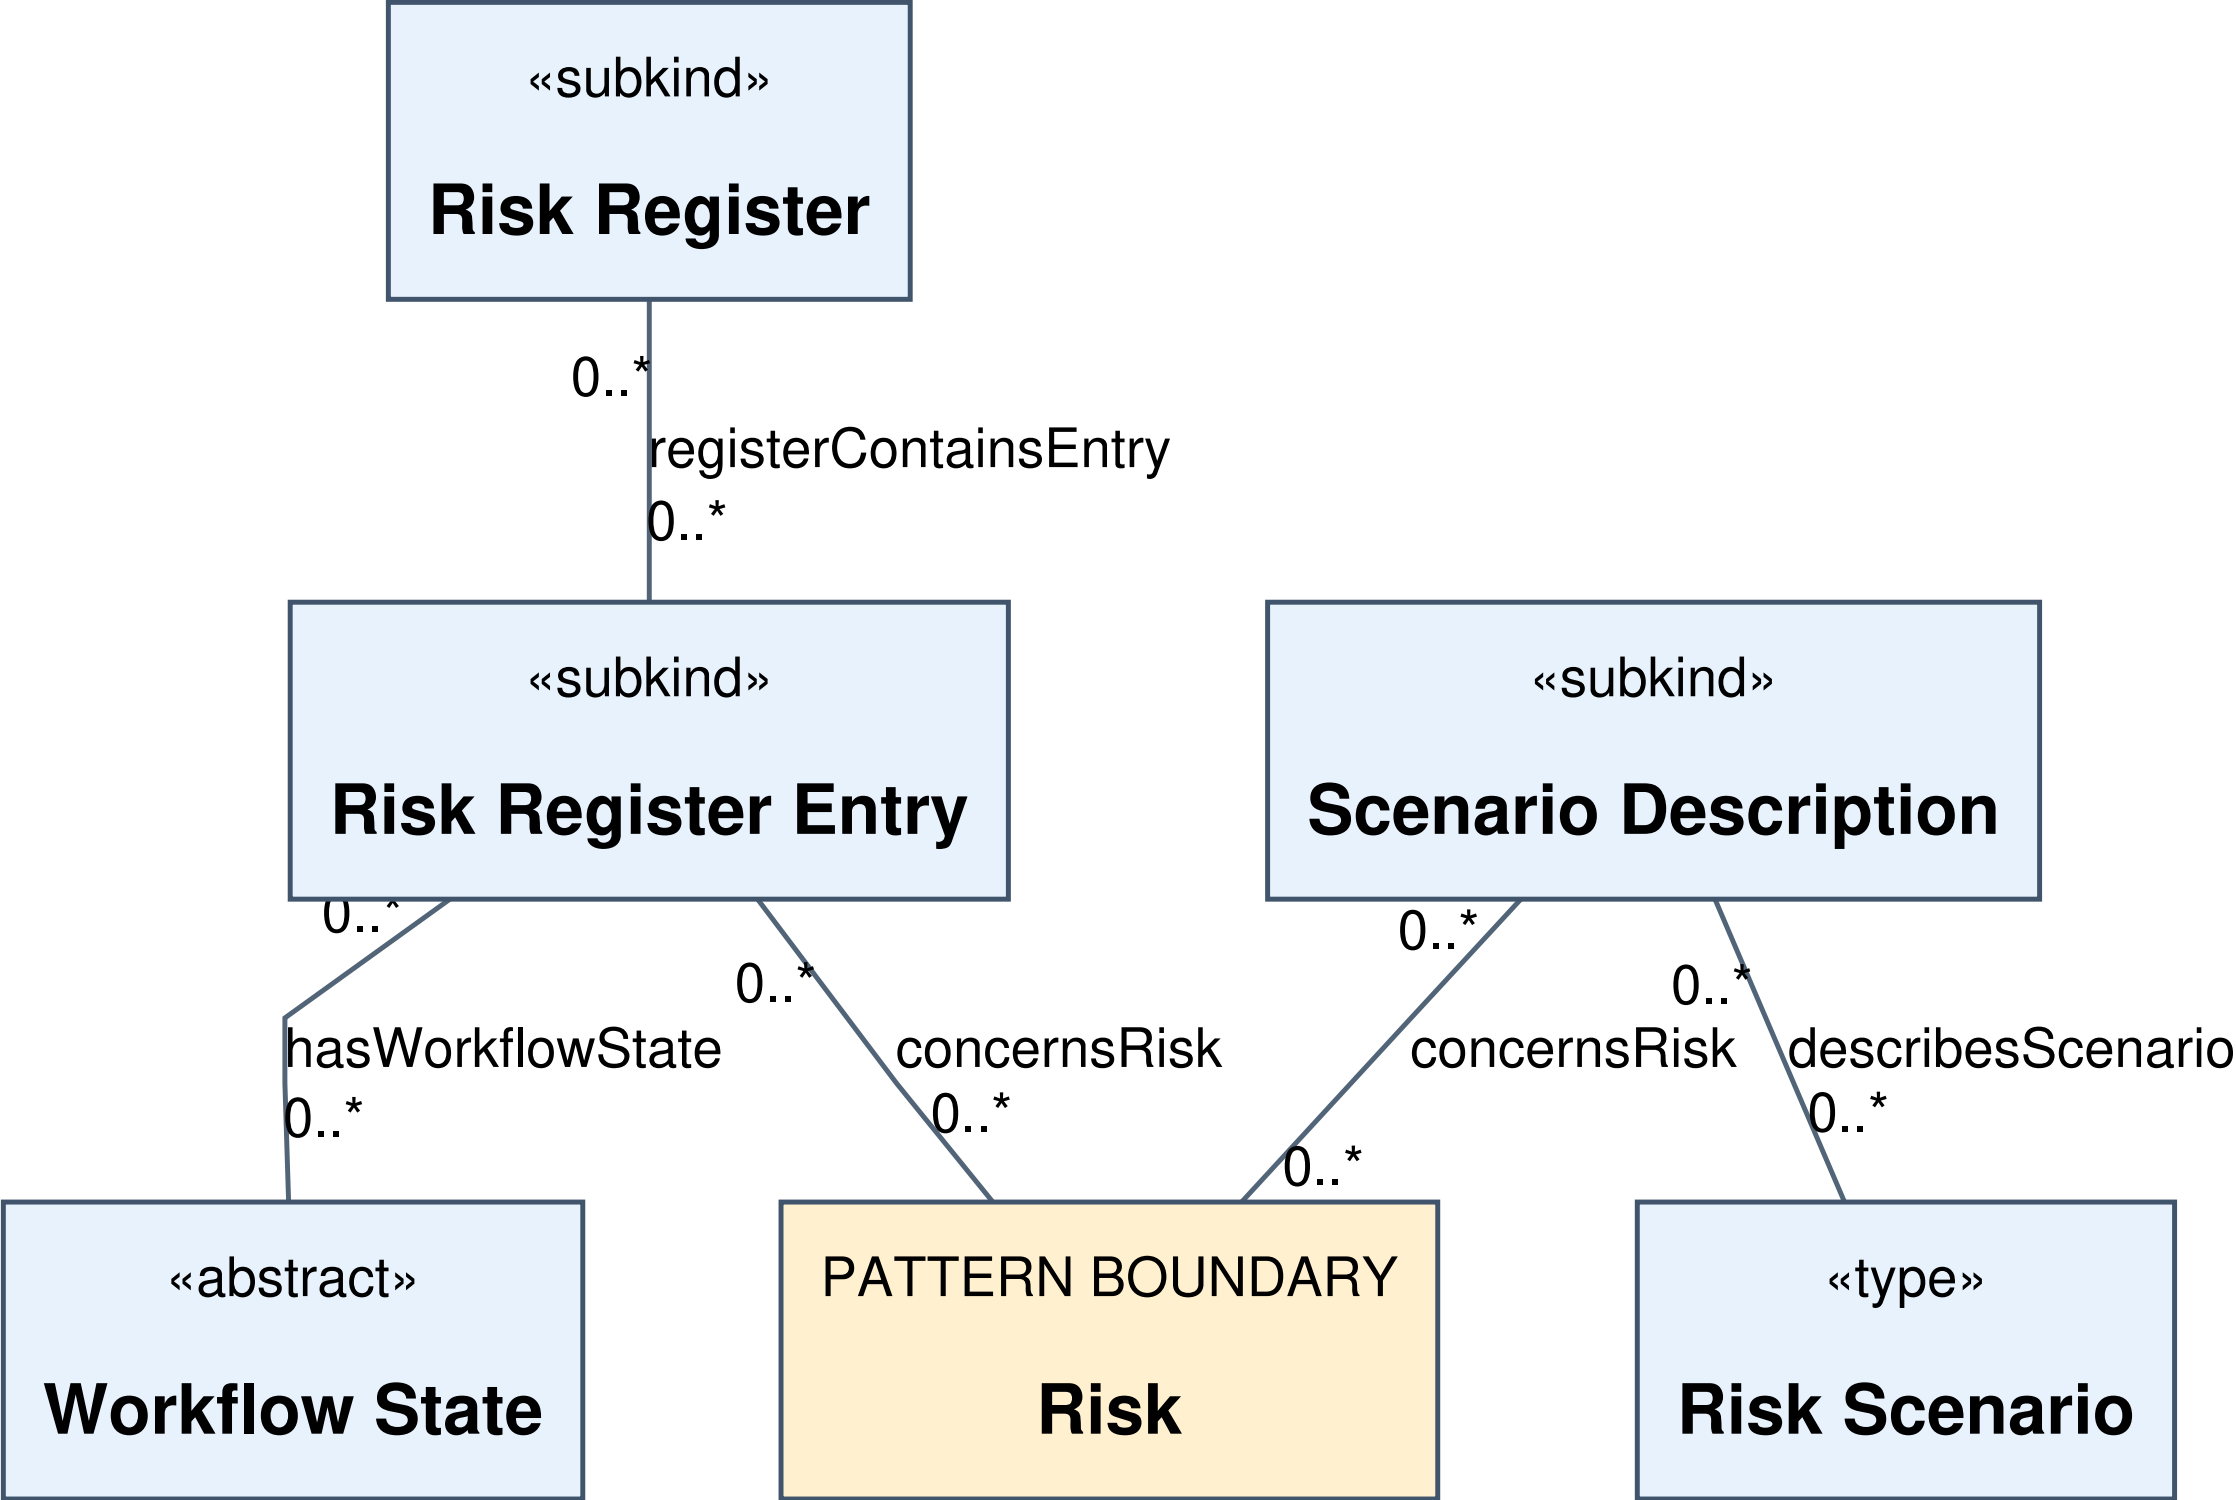

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Green profile mediation needs distinct Endurants. External Actor identity is not supplied locally; Risk Owner has no new sortal identity.

07 Register, description and workflow snapshot

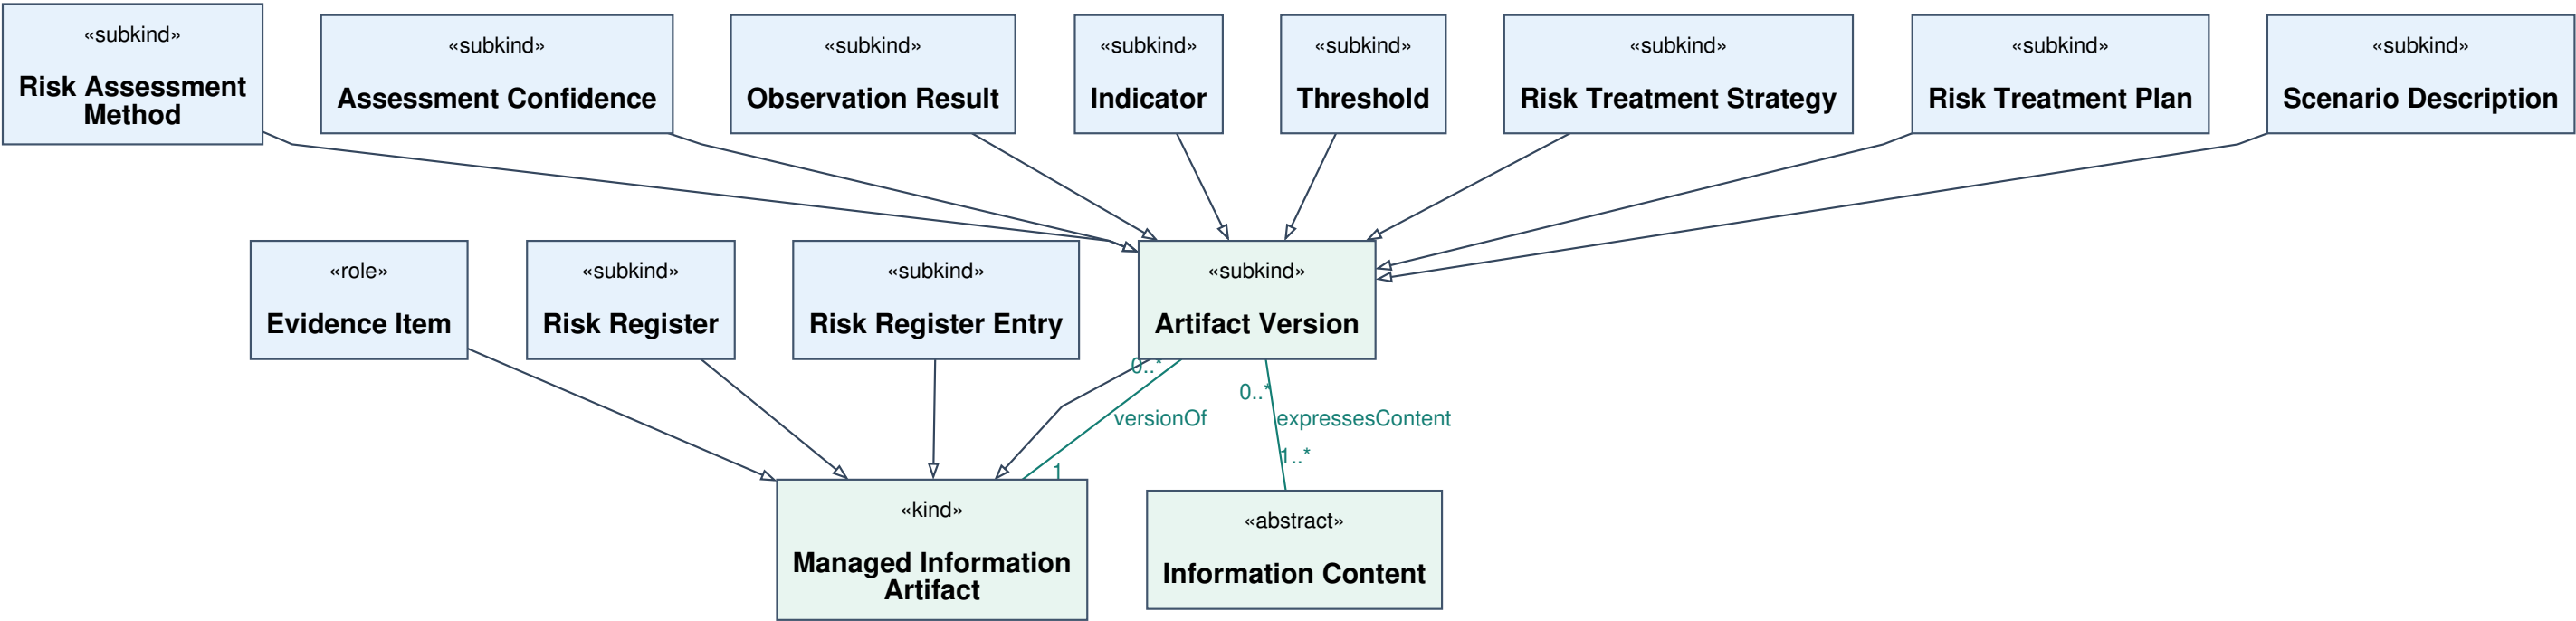

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Unqualified hasWorkflowState is a snapshot; use the separate qualified workflow view for historical answers.

08 Managed artifacts, versions and content

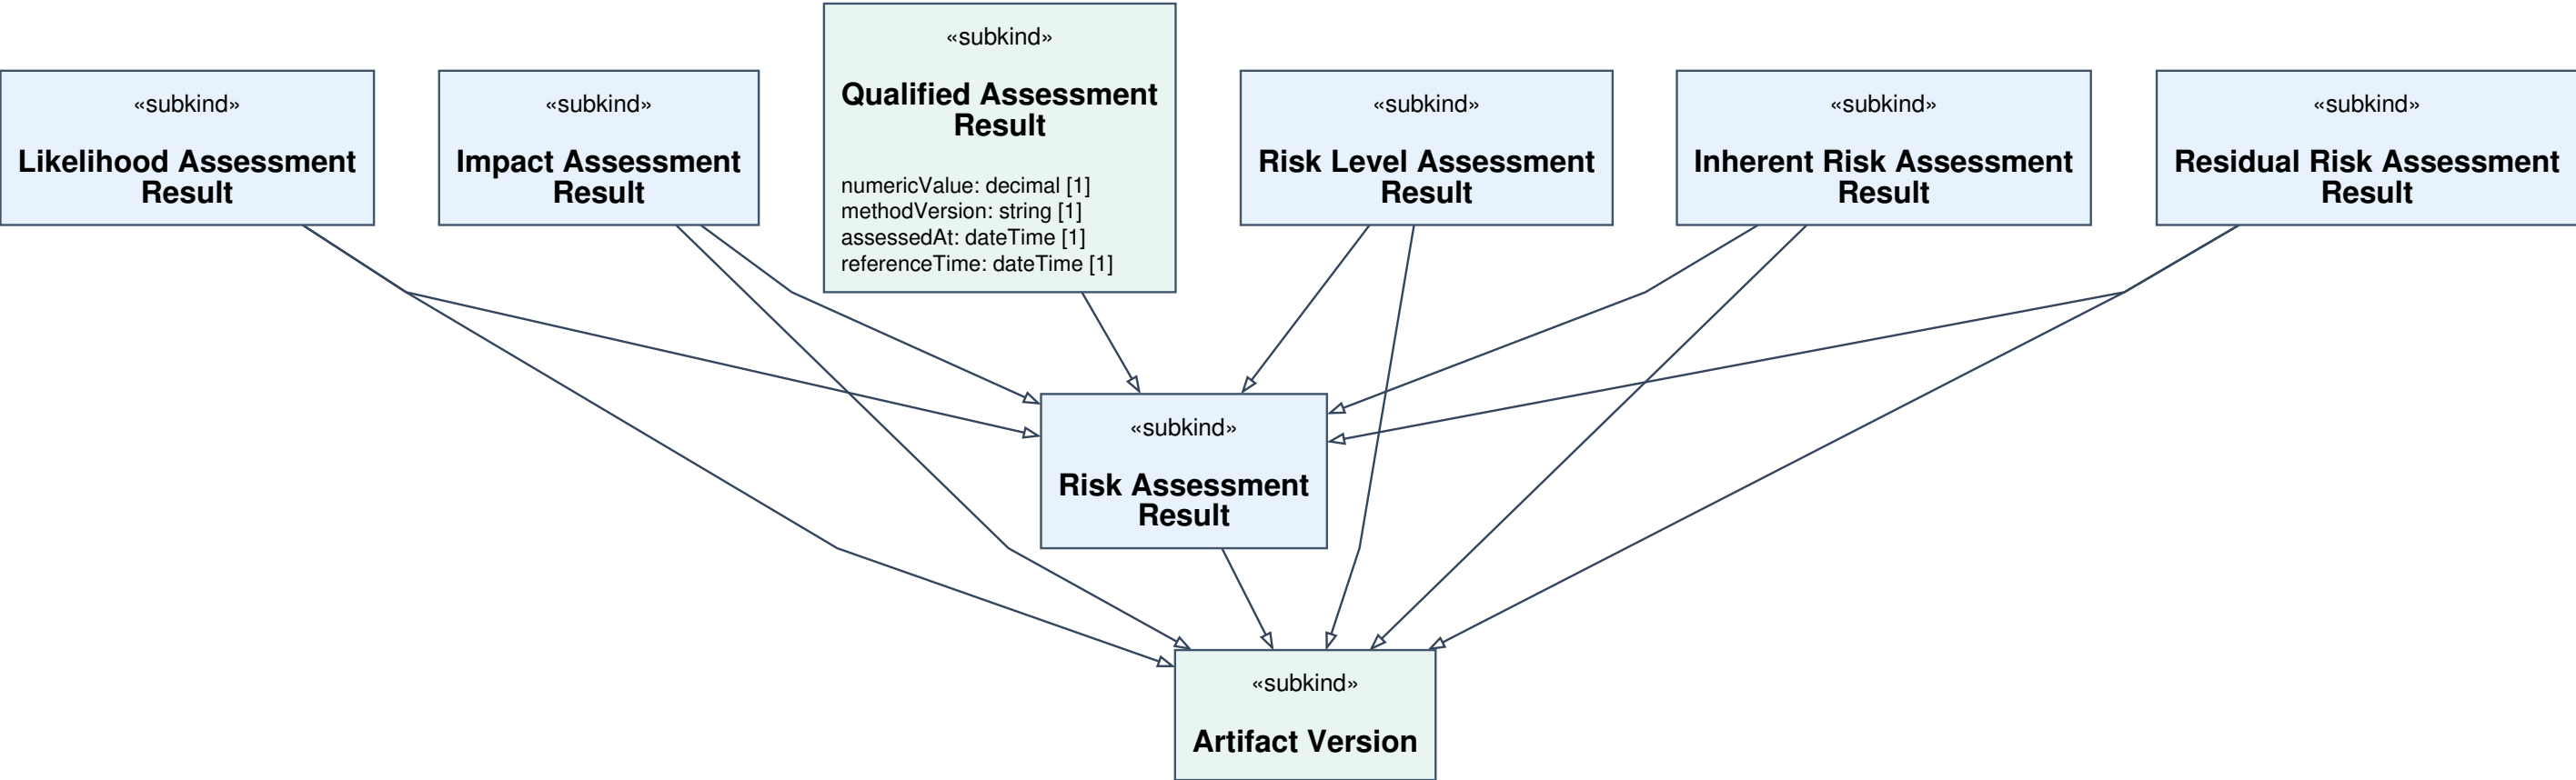

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Version/content multiplicities are strict data-profile requirements. Shared content does not merge artifact identity.

09 Result inheritance and qualified profile

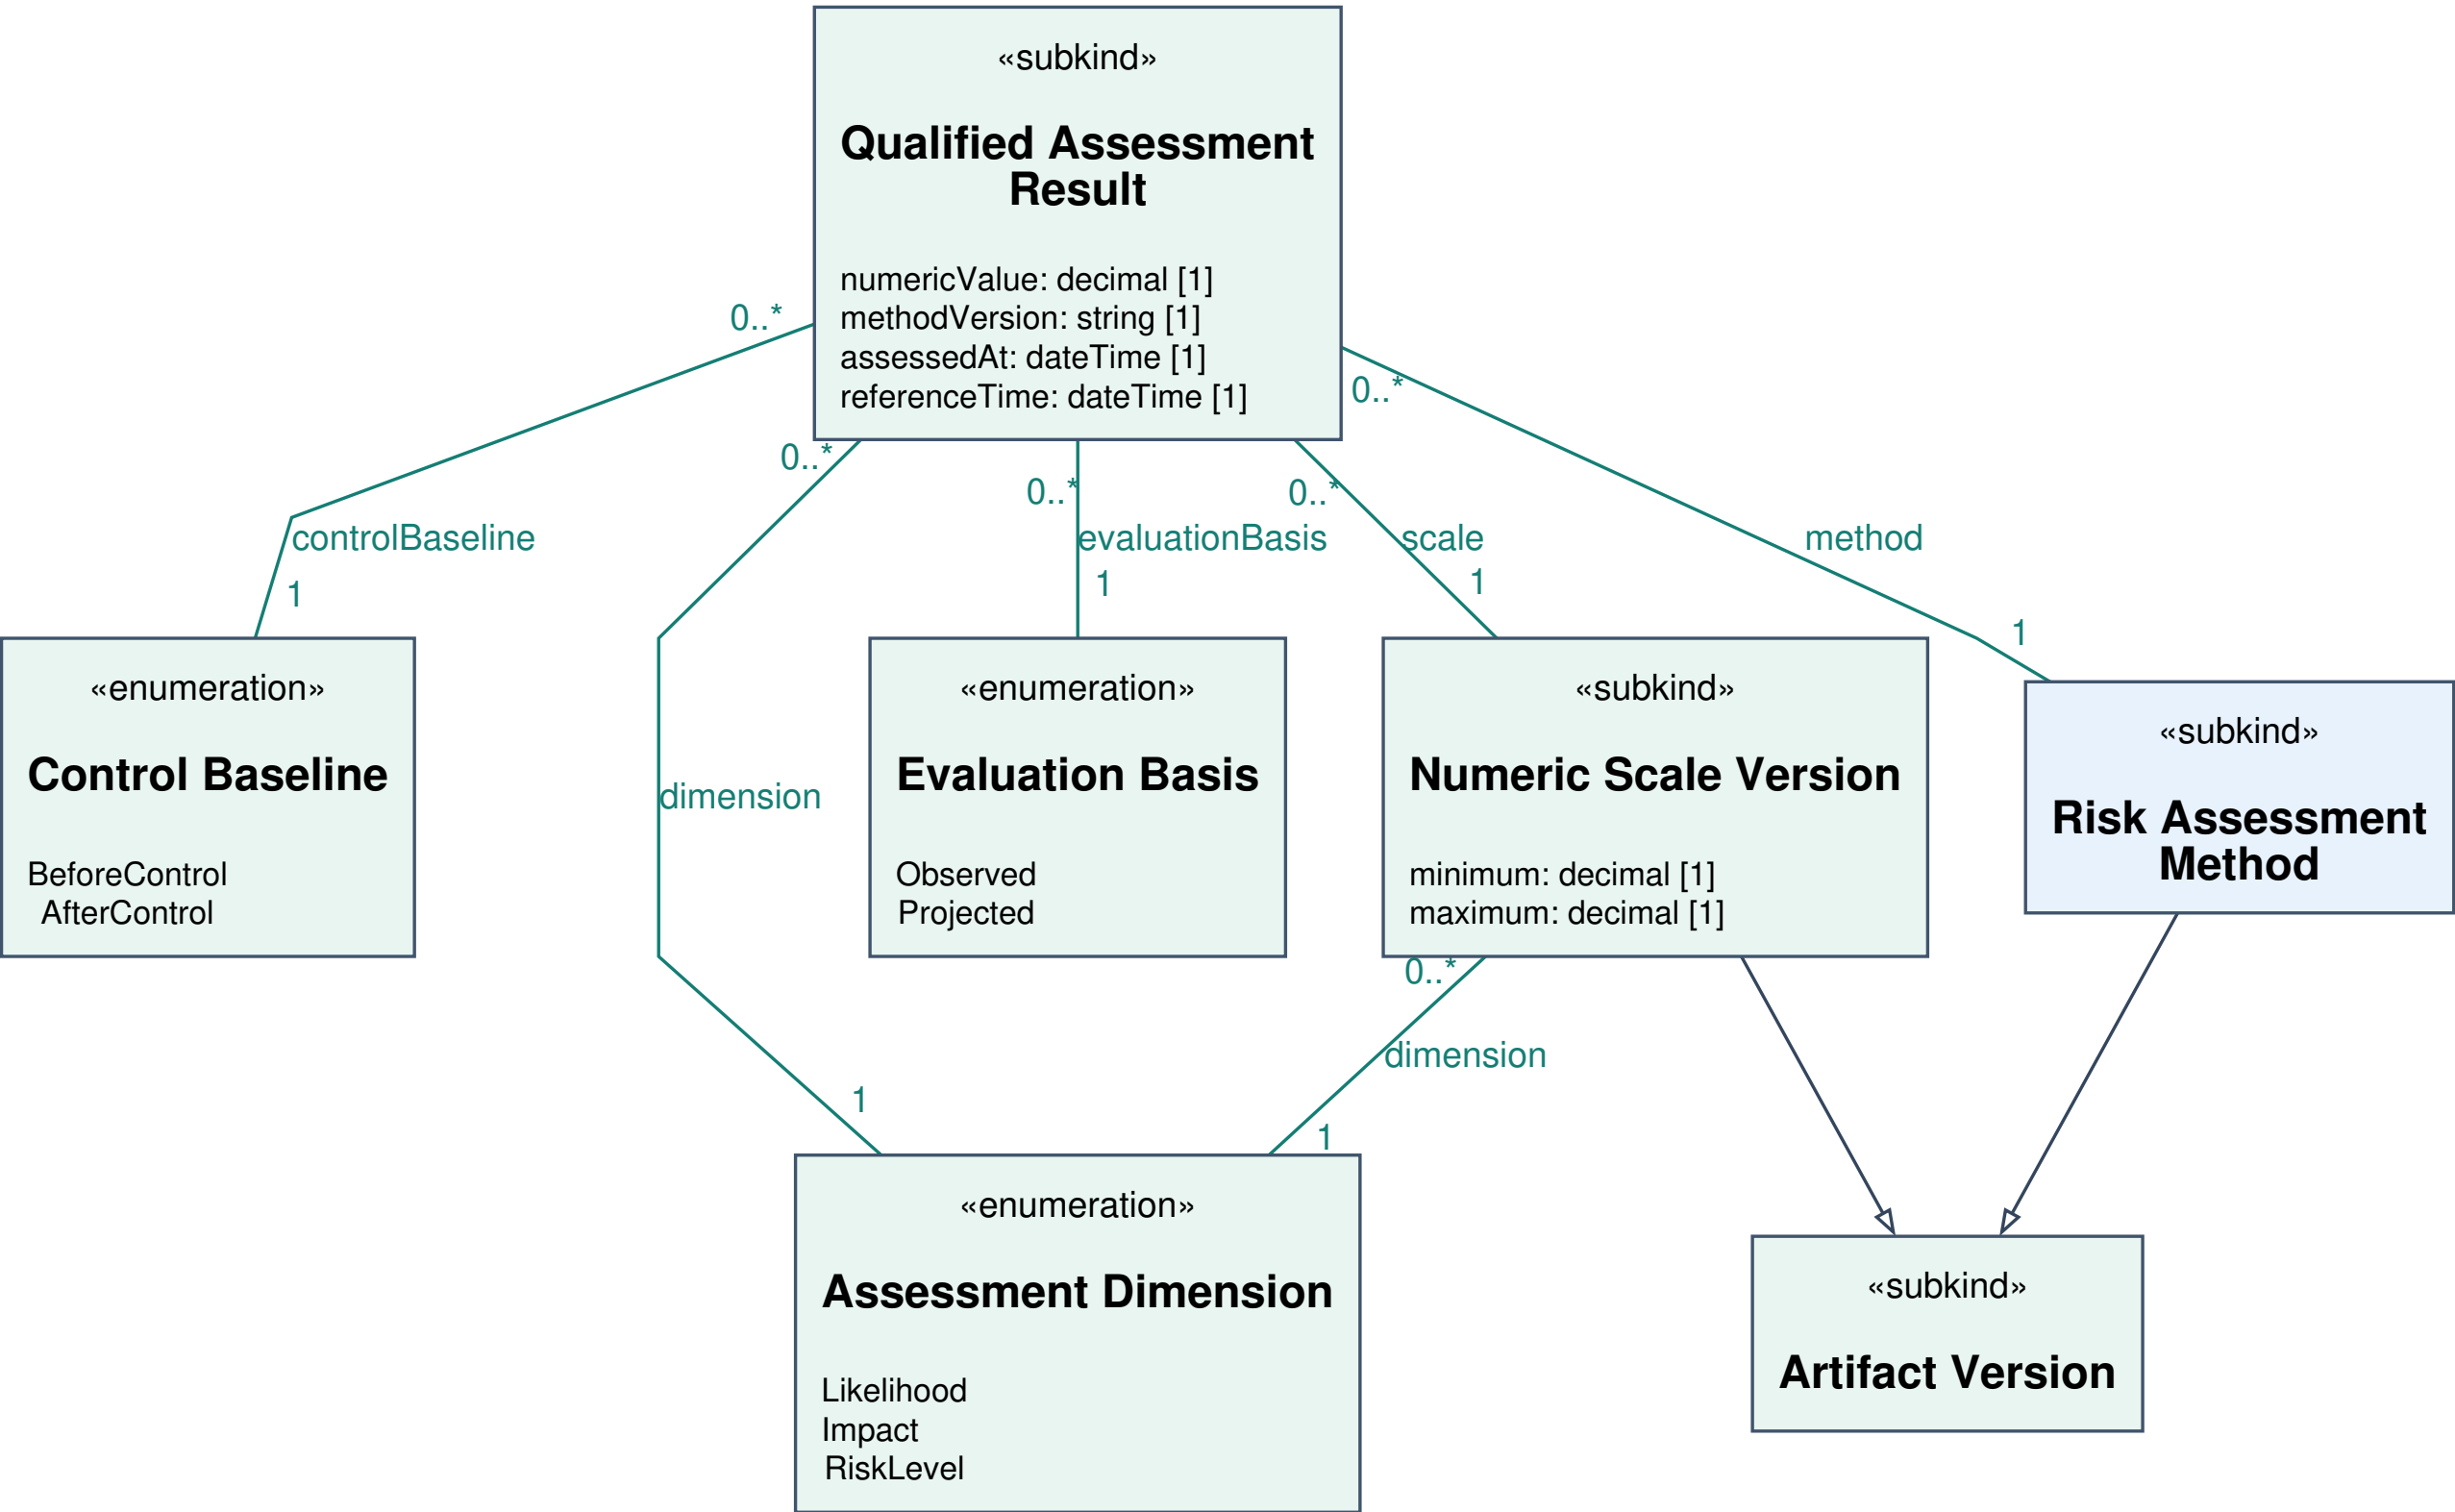

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

All shown named subclass axioms are asserted in rc.3; no new disjointness between independent result dimensions.

10 Qualified numeric assessment profile

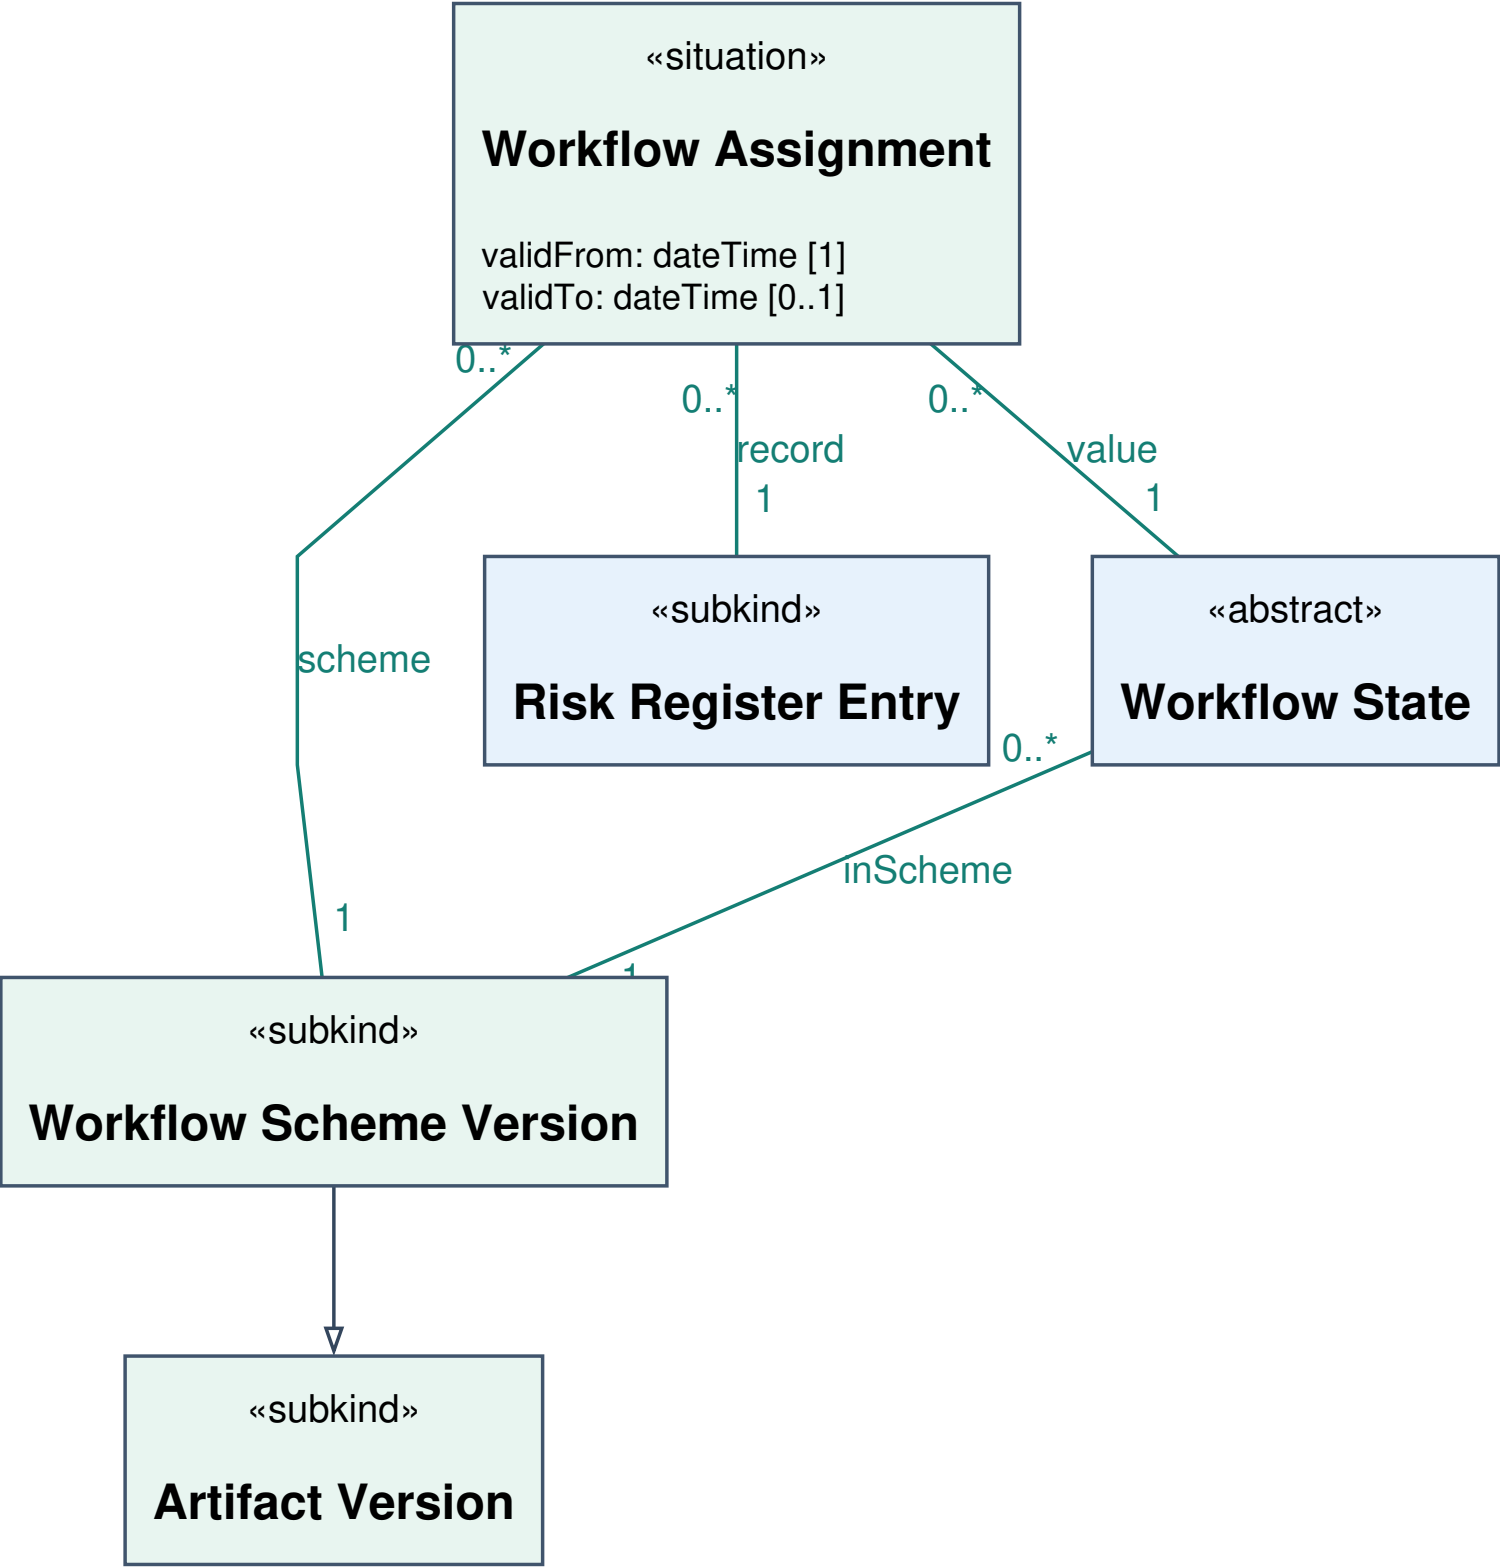

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Opt-in SHACL profile. Numeric Scale Version inherits ArtifactVersion identity; equal intervals do not merge versions.

11 Scheme-qualified temporal workflow

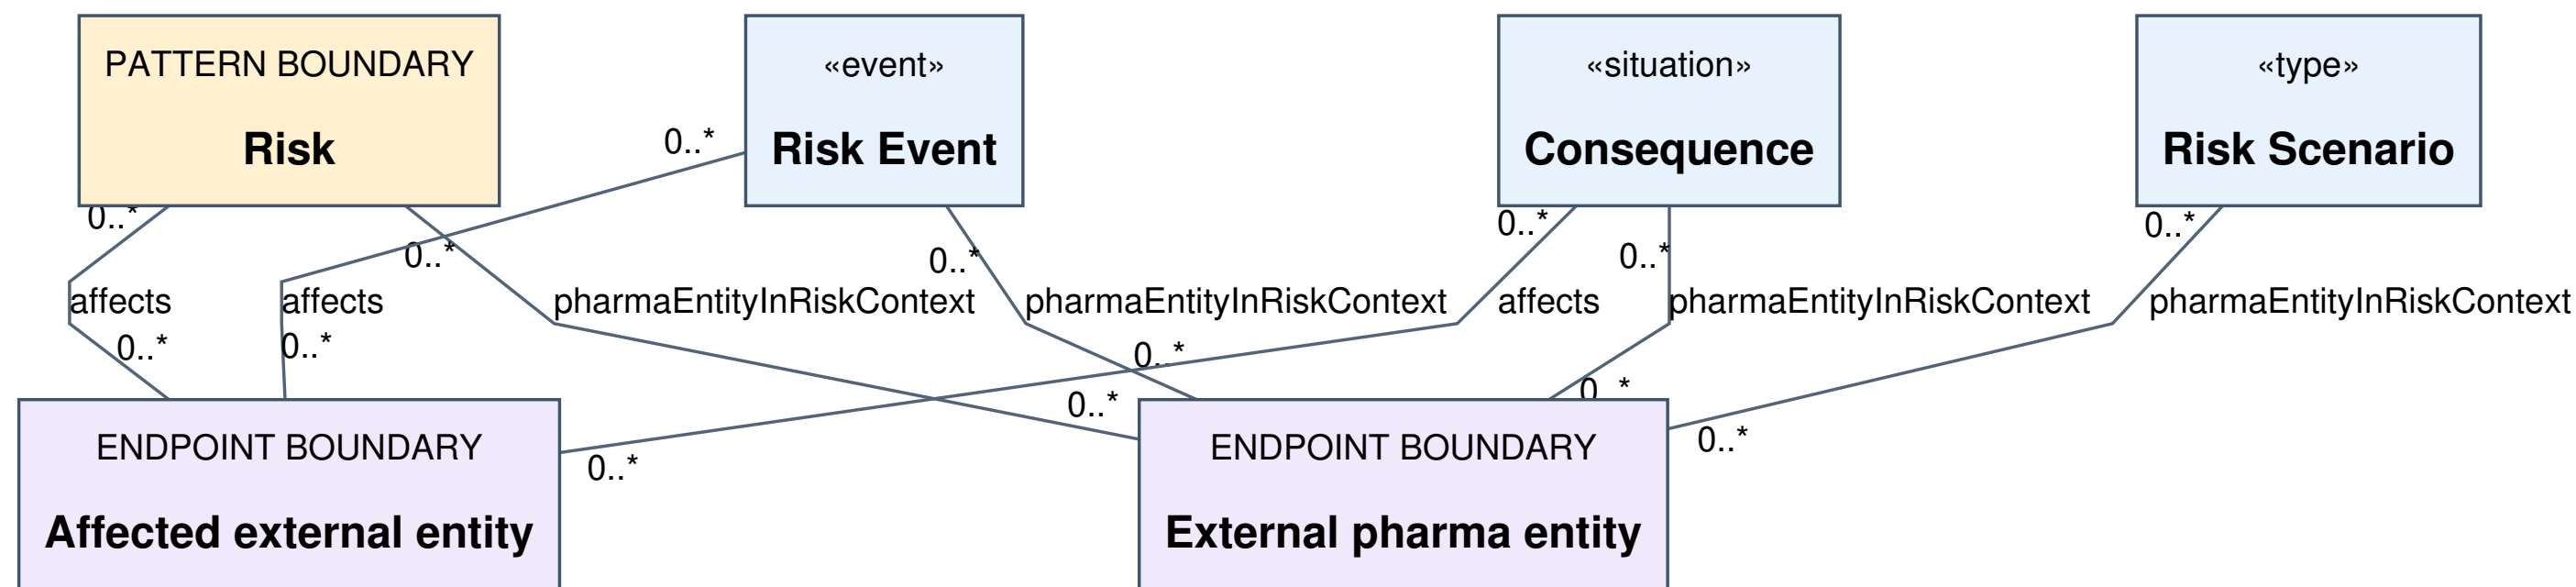

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Exactly one record/value/scheme per assignment. Half-open intervals; no overlap for the same record and scheme.

12 Enterprise and pharmaceutical references

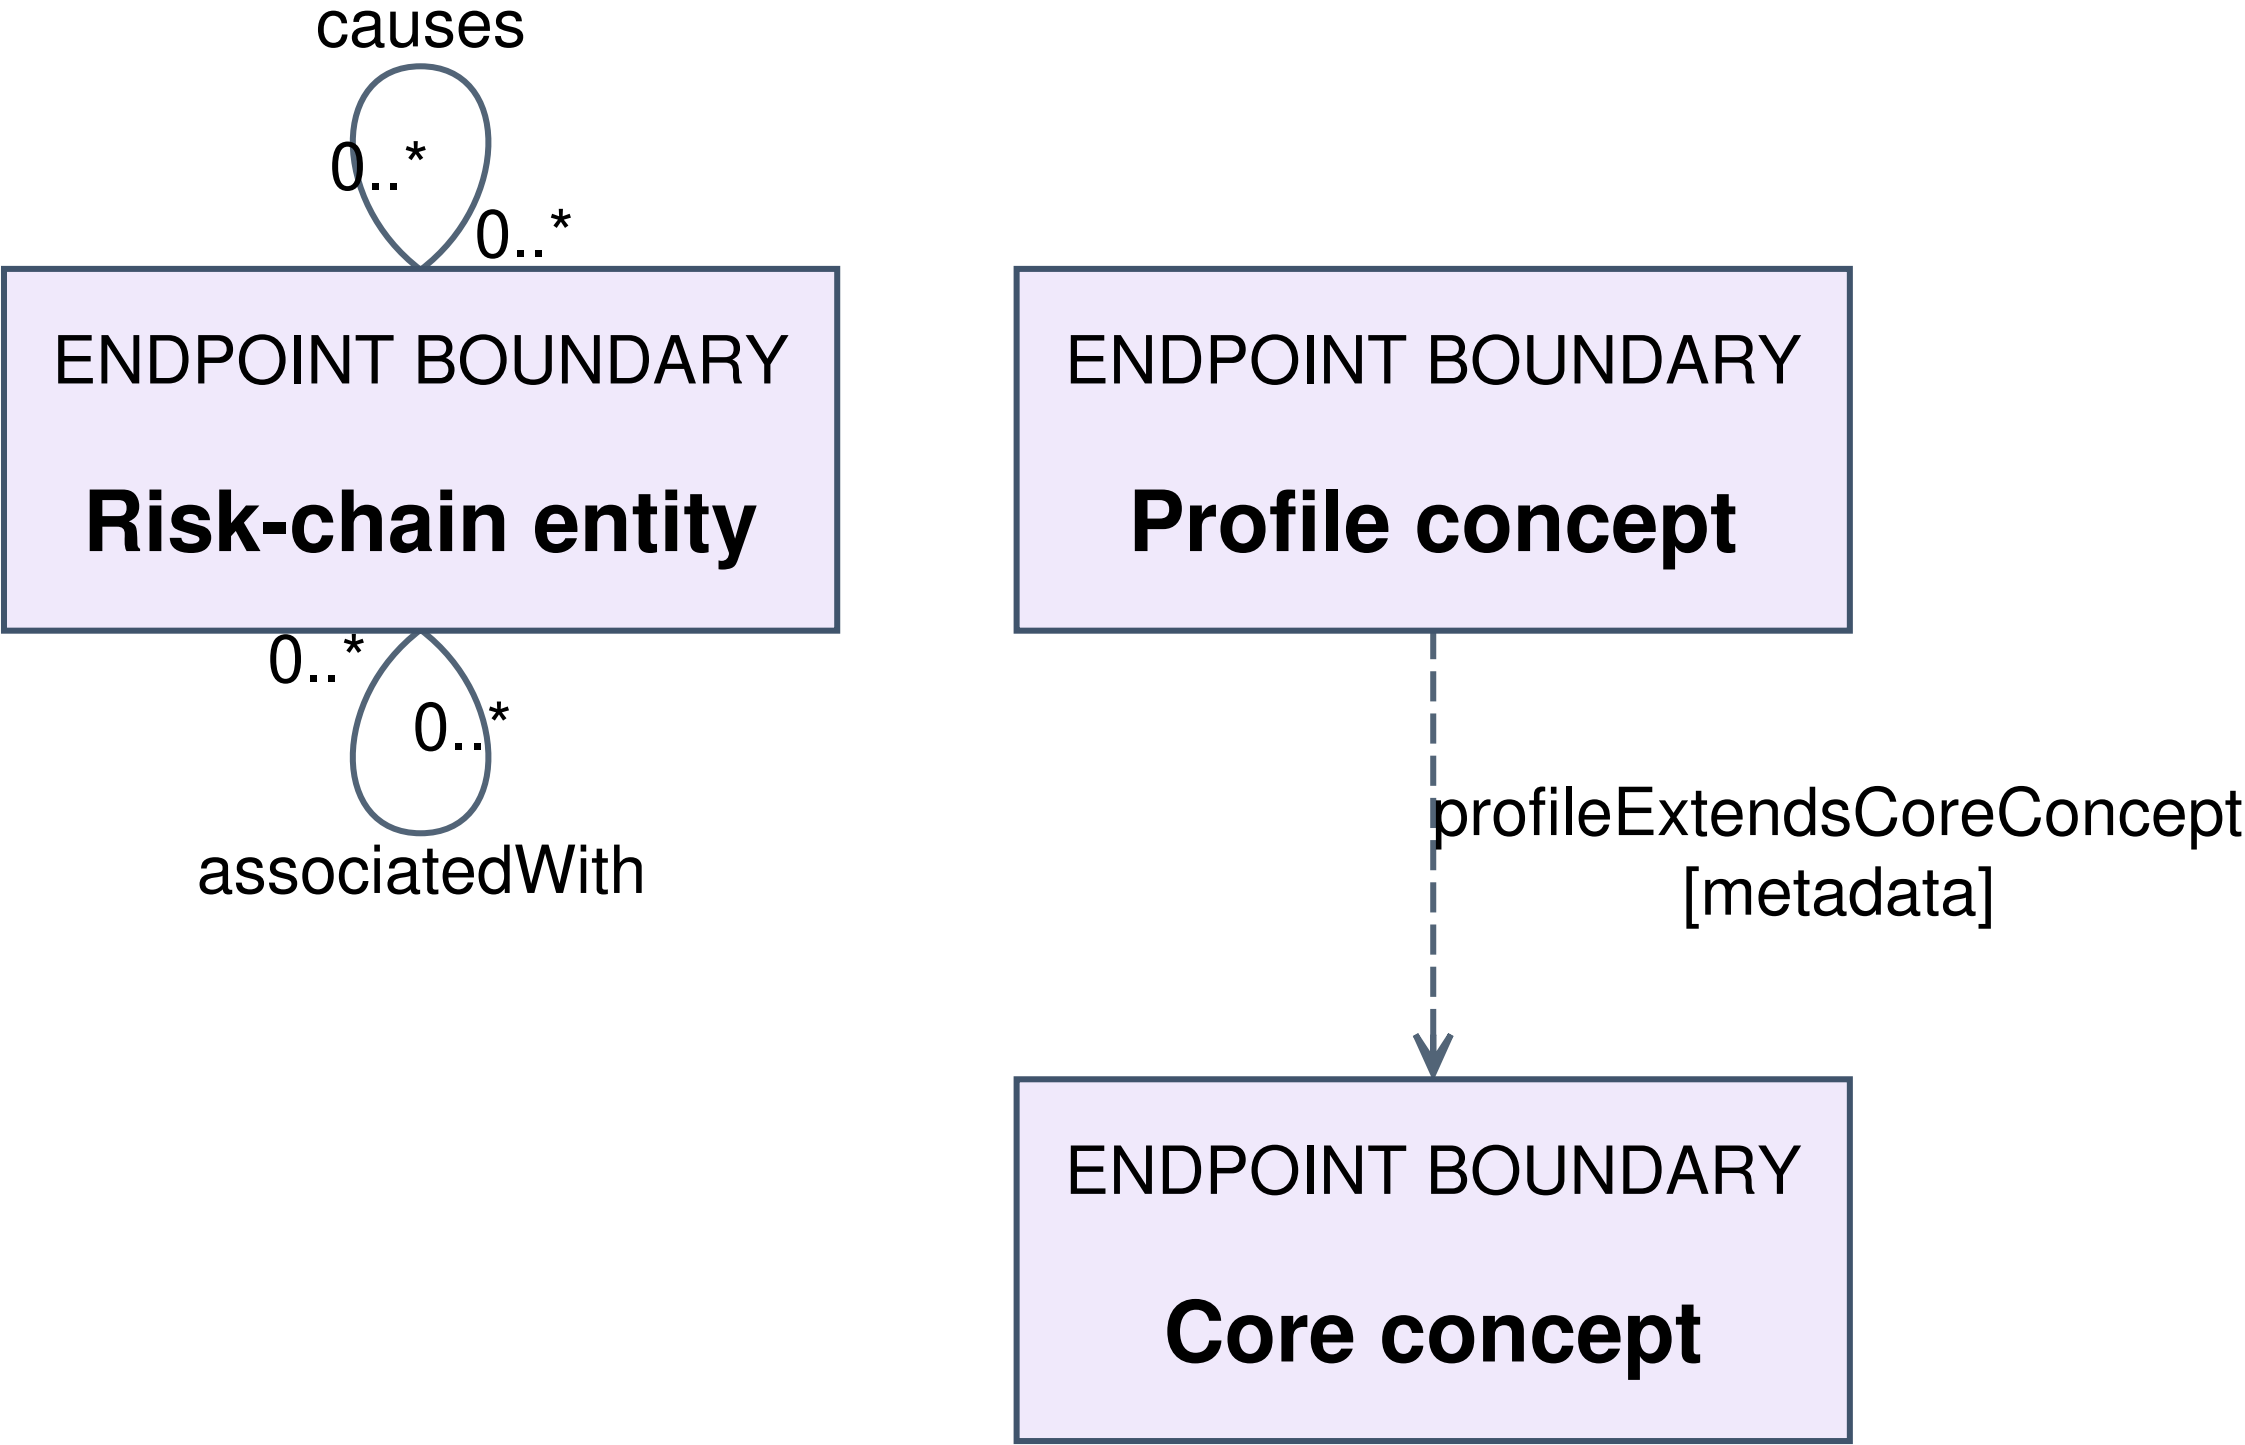

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

External endpoint references preserve their own identity. No invented CM-PharmE equivalence or asserted global domain.

13 Generic relations and extension metadata

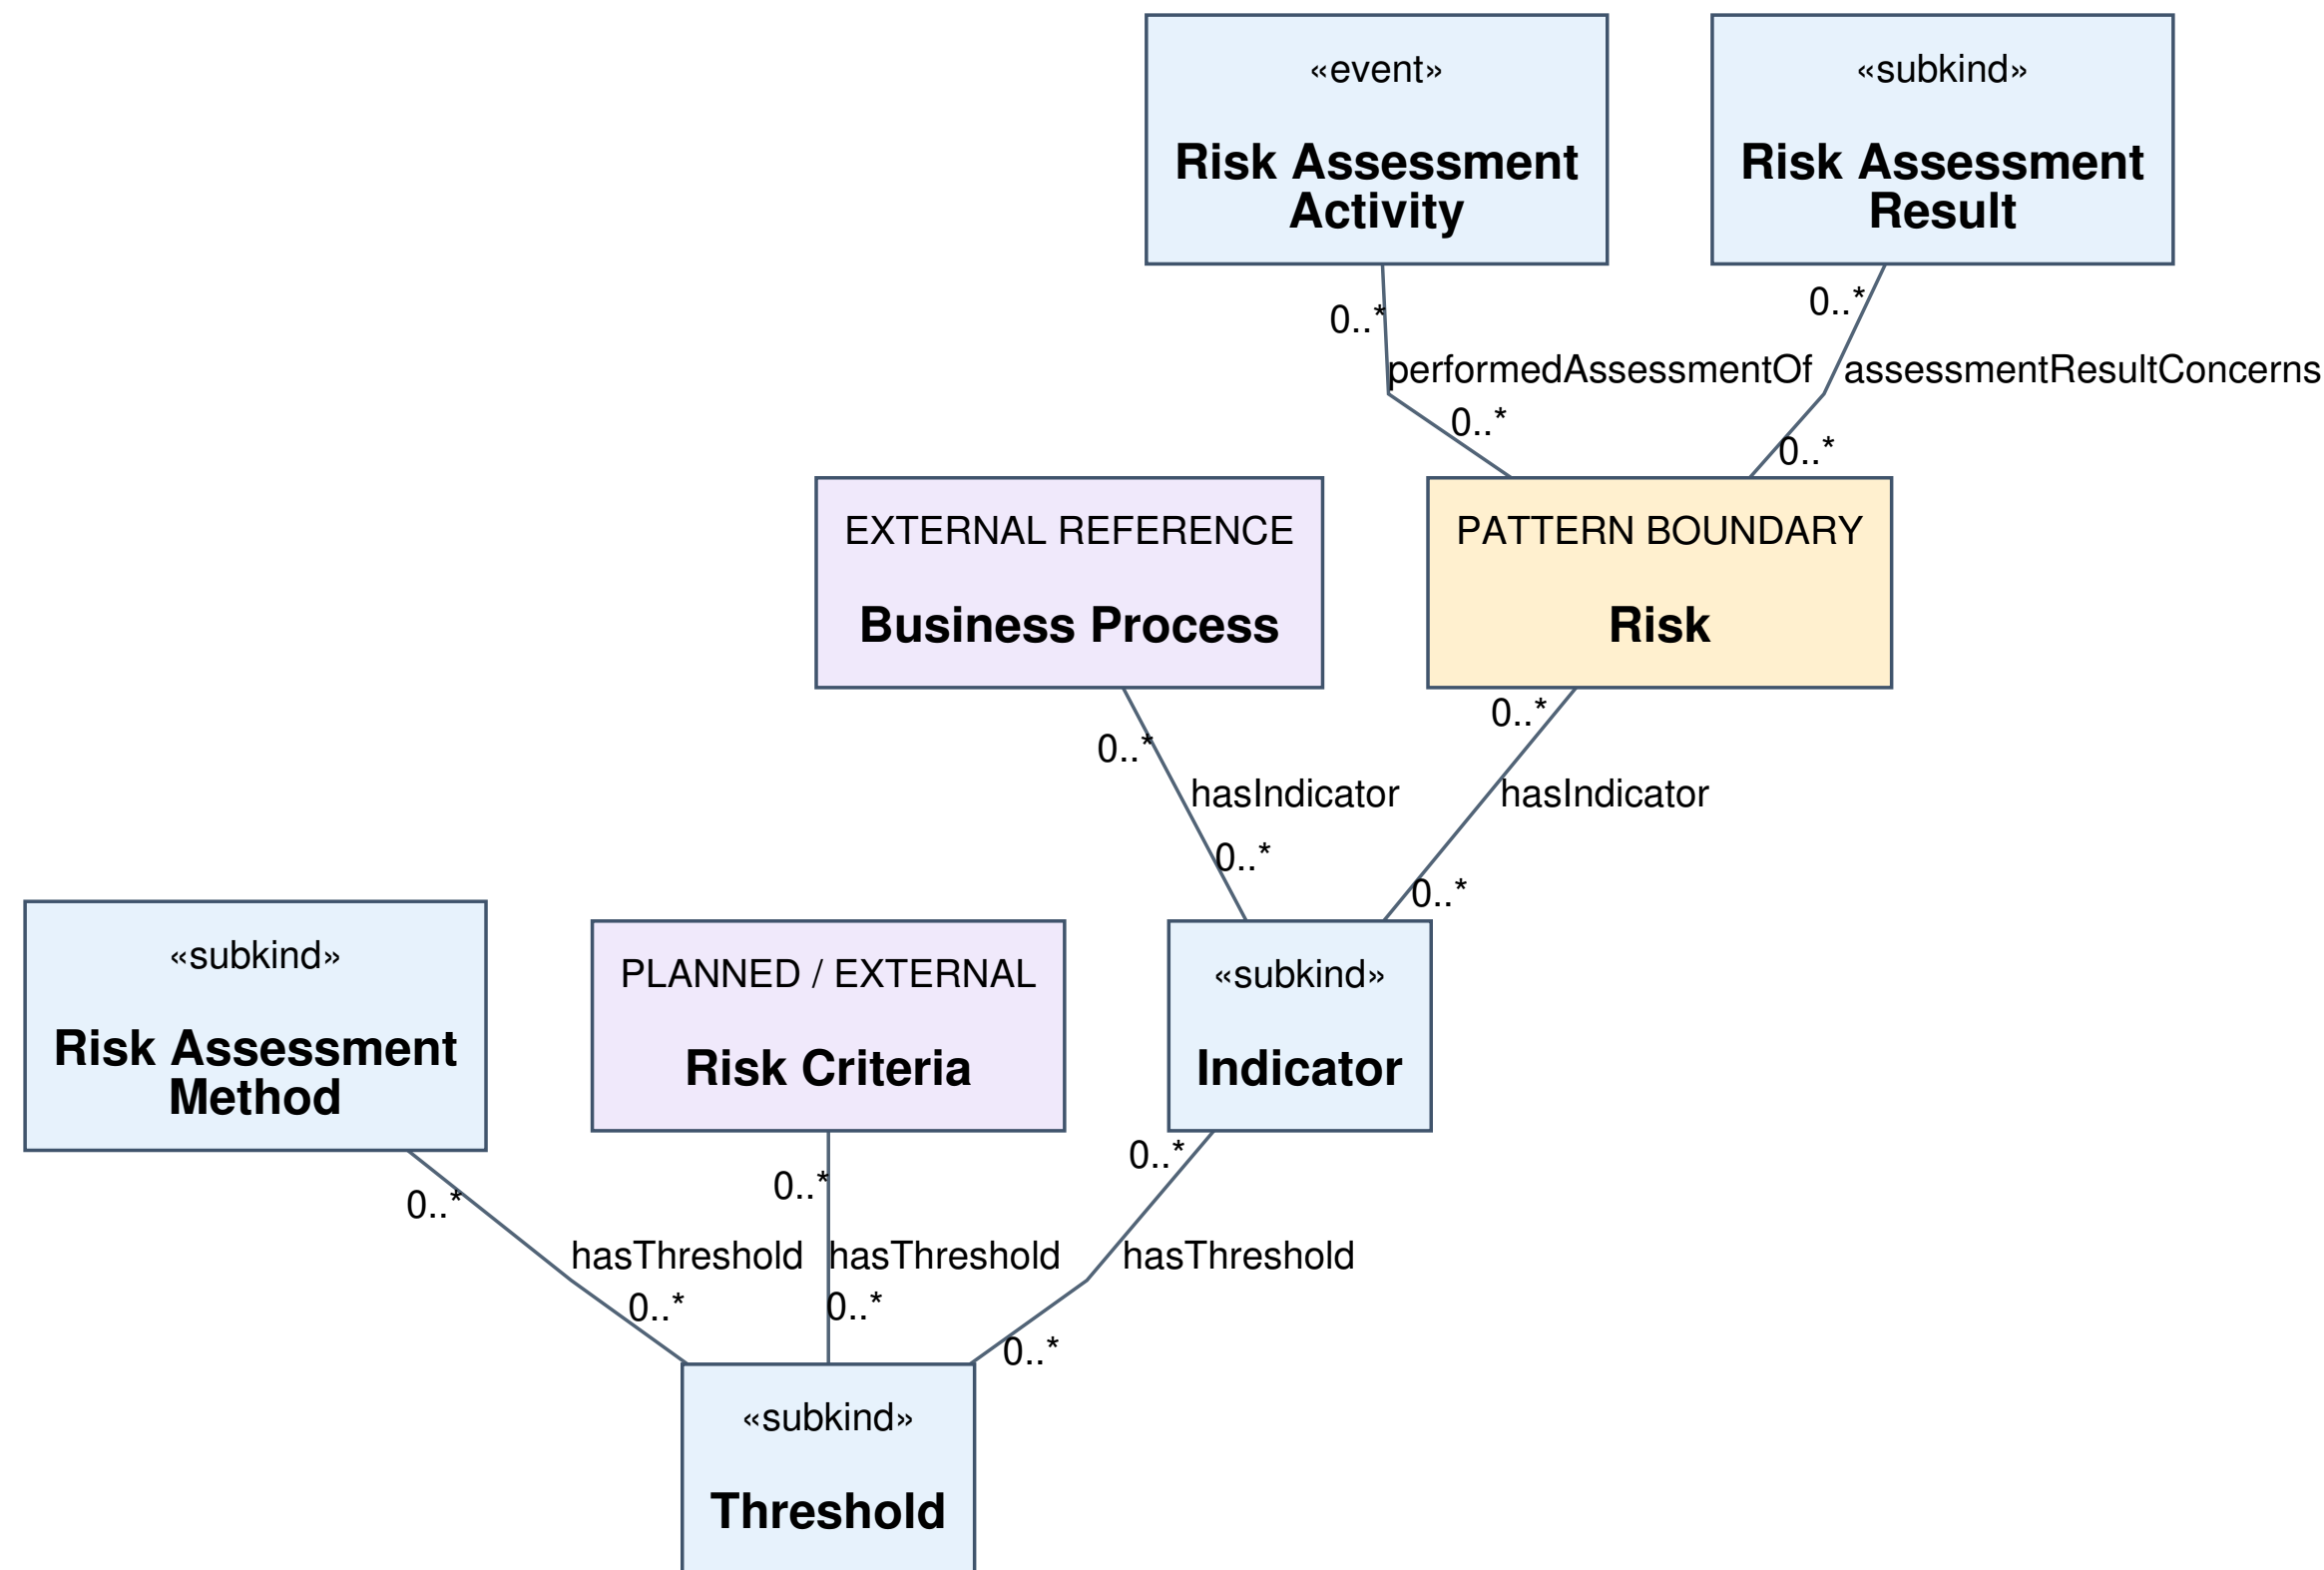

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

A generic association is not causality. Dashed extension is registry metadata, not an OWL property.

14 Assessment context and indicator links

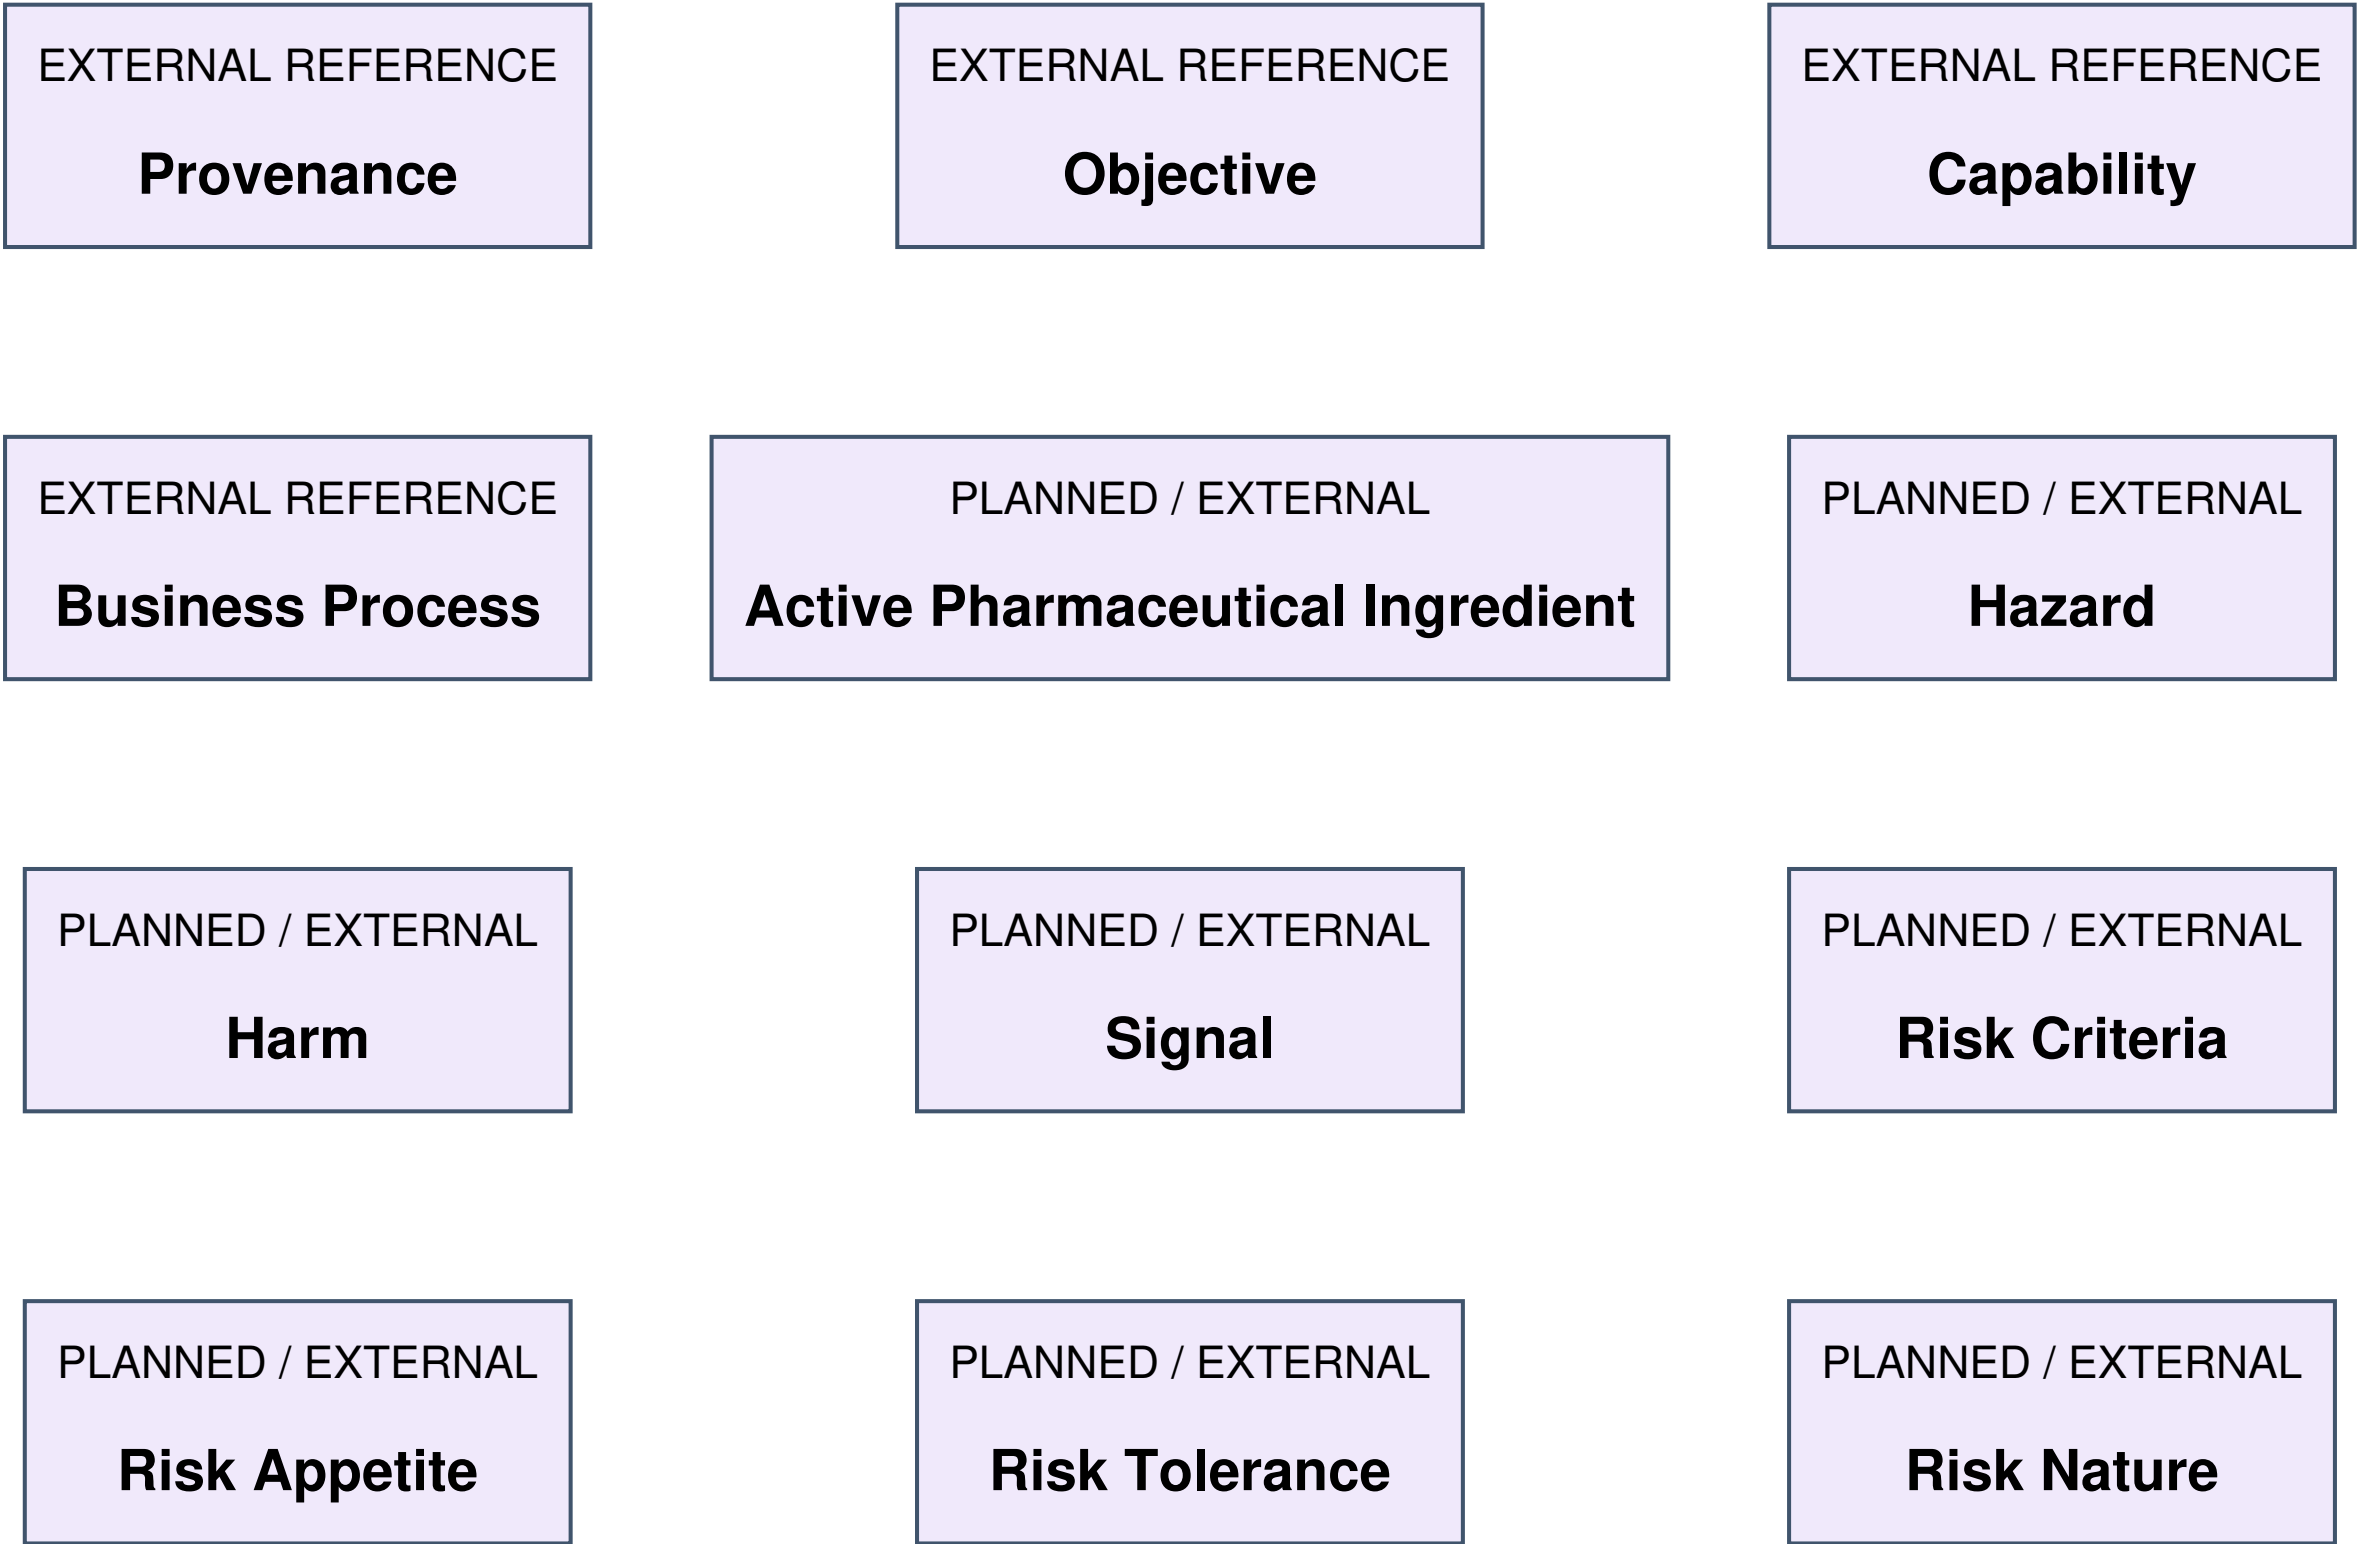

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

These typed endpoint projections do not narrow globally open property domains. External and planned concepts stay distinct.

15 External references and planned concepts

SemRisk 0.2.0-rc.4 | OntoUML-based view with explicit scope boundaries

Twelve reference slots: four registry markers and eight undeclared candidates. No implied implementation or equivalence.
